In the FERC proceeding a bipartisan group of former FERC Chairs and Commissioners, appointed by every President since Ronald Reagan, submitted comments (Attachment 2) opposing the Secretary's proposal, saying in summary:

The published proposal in this Docket would be a significant step backward from the Commission's long and bipartisan evolution to transparent, open, competitive wholesale markets. Pursuing the worthy goal of a resilient power system, the Commission's adoption of the published proposal would instead disrupt decades of substantial investment made in the modern electric power system, raise costs for customers, and do so in a manner directly counter to the Commission's long experience.

Comments of PJM

As the Secretary and Department are aware, PJM is the independent regional transmission organization responsible for operating and planning a reliable grid across 13 states and the District of Columbia. PJM submitted extensive comments (Attachment 3) stating as relevant here (page 14):

The evidence and events that the DOE NOPR cites do not support its assertion of a resilience crisis or its rationale for degrading competitive markets in the name of fuel resilience. As experience during extreme weather events has shown, myriad factors contribute to outages, and fuel security, while beneficial, provides no guarantee of resilience during such events. Given the paucity of evidence to support its expensive and anticompetitive cost of service guarantee, the DOE NOPR appears aimed less at truly addressing resilience concerns and more at benefitting certain preferred generators and fuels and the industries they support. ... the DOE NOPR offers nothing to show that market regions in general, or the PJM Region in particular, is in any danger of failing to meet reliability or resource adequacy requirements now or in the future. This is not surprising, as the PJM Region unquestionably is reliable, and its competitive markets have for years secured commitments from capacity resources that well exceed the target reserve margin established to meet NERC requirements. And the PJM capacity market also includes rigorous performance requirements, enforced by market mechanisms—which were affirmed just this year by a U.S. Court of Appeals.

FERC Order

As the Secretary and Department are aware, the independent FERC is the federal agency responsible for grid reliability and for just and reasonable wholesale rates. Four of the five sitting Commissioners were appointed by President Trump.

FERC unanimously rejected the Secretary's proposal (Attachment 4), stating: "... the extensive comments submitted by the RTOs/ISOs do not point to any past or planned generator retirements that may be a threat to grid resilience." (paragraph 15).

Specifics on the Emergency Claim

As the Secretary and Department are aware, there is a very high bar for exercise of emergency authority under Section 202(c) of the Federal Power Act.

The White House and the Department determined last year that the evidence did not warrant use of this emergency authority, stating (Attachment 5):

We look at the facts of each issue and consider the authorities we have to address them, but with respect to this particular case at this particular time, the White House and the Department of Energy are in agreement that the evidence does not warrant the use of this emergency authority.

There has been no material change in circumstances since the White House and Department

determined that use of emergency authority was not warranted.

Indeed, Robert Murray, CEO of Murray Coal, the co-advocate with FirstEnergy at the FERC and elsewhere, now states per the attached article (Attachment 6) that there is no need for a bailout. The FERC, PJM, and countless industry analysts have said that there is no emergency. As PJM discussed in its comments it has commitments for generation resources for more than three years ahead that are much greater than forecasted peak demand. And additional efficient, reliable resources are being added every year.

Moreover, subsequent to its filing with the Secretary and Department, FirstEnergy informed the bankruptcy court that all of its nuclear and coal plants will continue operating during its bankruptcy proceeding, as reported in the attached article (Attachment 7): "Attorneys for FirstEnergy Solutions say the company's coal and nuclear power plants will keep producing electricity while the company undergoes reorganization under bankruptcy."

That bankruptcy proceeding will take years, as reported in the attached article (Attachment 8). A local bankruptcy expert is quoted as saying "'It can take, on the short end, five or six years [to resolve]. I would think it can take longer than that'" said Joseph Ferrise, staff attorney for the downtown Akron office of the Chapter 13 trustee, who oversees local individual bankruptcy cases." Thus, the FirstEnergy plants will not be retiring for the foreseeable future.

Contrary to FirstEnergy's claim that there is a rising tide of coal and nuclear retirements, there have been relatively few deactivation (retirement) requests recently submitted to PJM – other than by FirstEnergy (Attachment 9). And, as noted above, notwithstanding those deactivation notices submitted by FirstEnergy, none of the FirstEnergy plants will actually be retiring for the foreseeable future.

In addition, Mr. Murray states (Attachment 10) that he is looking to buy FirstEnergy plants which he says he can operate better than FirstEnergy. Mr. Murray's comments support the propositions that (1) there are buyers for these plants and (2) FirstEnergy's problems are of its own making.

Any Emergency Would Be a National Emergency

If the Secretary and Department find there is an emergency in PJM, which has commitments for ample generation resources more than three years into the future, then there must be emergencies in all the other organized markets. And there may be emergencies in the rest of the United States, wherever state regulators have not mandated the quantity and mix of generation resources that the Secretary and Department deem necessary for non-emergency conditions. As the Secretary and Department are aware, many coal plants have retired outside of the organized markets and continue to do so.

Consequently, if the Secretary and Department were to find there is an emergency in PJM it would be imprudent for the Secretary and Department to exclude any part of the United States from an emergency order. In addition, the Secretary and Department should request Congress to pass legislation on an emergency basis to extend the jurisdiction of Section 202(c) to Texas, Hawaii and Alaska so that the emergency order can apply to those states as well.

Selection of, and Compensation for, Coal and Nuclear Plants

If, against facts and law, the Secretary and Department determine to exercise emergency authority it would present the question of selecting and compensating the plants to be subsidized.

Section 202(c) is part of the Federal Power Act, which states in Section 205(a) that "All rates and charges made, demanded, or received by any public utility for or in connection with the transmission or sale of electric energy subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges shall be just and reasonable, and any such rate or

charge that is not just and reasonable is hereby declared to be unlawful.”

There is no exception for emergency orders under Section 202(c) which itself says that the terms, including compensation, shall be “just and reasonable.” “Just and reasonable” has been interpreted for decades as meaning the lower reasonable cost consistent with the maintenance of adequate service.

It would be unjust and unreasonable to compensate any coal and/or nuclear plants beyond the minimum amount of capacity deemed necessary to alleviate the purported emergency, and it would be unjust and unreasonable to provide compensation beyond that necessary to keep that minimum amount of capacity from retiring. To ensure the lowest reasonable cost that minimum amount of capacity should be acquired in a competitive auction among entities that PJM and the PJM Market Monitor determine would otherwise retire absent subsidy. An auction also ensures that to the extent an entity is erroneously deemed eligible it would tend to bid low for subsidies.

As for FirstEnergy in particular, it was paid \$6.9 billion in “stranded costs” by consumers in return for transitioning to a competitive market, as reported in the attached Q&A by the utility AEP Ohio (Attachment 11). It would be an unjust and unreasonable windfall for FirstEnergy to keep the stranded cost payments and get paid again with out-of-market subsidies. Therefore, to the extent FirstEnergy plants elect to offer their capacity for potential subsidy, it should be a condition of their eligibility that stranded cost payments of \$6.9 billion (plus interest) be deducted from what FirstEnergy would otherwise be paid. When consumers have been fully reimbursed for their stranded cost payments FirstEnergy plants could begin receiving auction revenue.

Thank you for your consideration of these comments.

Respectfully submitted,

Stephen L. Huntoon

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

Grid Reliability and Resilience Pricing

)

Docket No. RM18-1-000

**COMMENTS OF
STEPHEN L. HUNTOON**

Pursuant to the *Federal Register* notice of proposed rulemaking published by the Commission on October 10, 2017, the undersigned hereby respectfully submits these comments on the U.S. Department of Energy proposal (DOE proposal) in this proceeding.

I have practiced energy regulatory law for 35 years, served as a former President of the Energy Bar Association, and been involved in most of the major regulatory initiatives of the Commission involving the electric industry. A short biography is provided in Attachment A.

I have written three columns on the DOE proposal which have been published in *RTO Insider*. These columns are provided in Attachment B and are incorporated herein by reference.

Some key points from those columns:

- The DOE proposal would potentially subsidize tens of gigawatts of uneconomic plants, and cost consumers many tens of billions of dollars a year.
- These subsidies would crash market prices and force economic plants on to federal subsidies as well, thus ending the organized markets.
- Retiring plants have three times the forced outage rate of the new plants that the DOE proposal would forestall. Thus, the DOE proposal would undermine grid reliability.
- Natural gas supply was not the major problem in the Polar Vortex as PJM data and testimony demonstrate.

- A 90-day fuel supply requirement has no rational basis. In the Polar Vortex, for example, PJM generation emergencies aggregated 20 hours – less than two days.
- Following the Polar Vortex, PJM strengthened its capacity market to reward performance and penalize nonperformance and has not had a single system generation emergency in more than three years.
- The chance of a generation deficiency in PJM is much less than 1 in 5,000, based on data compiled by ReliabilityFirst Corporation, the regional entity responsible for overseeing PJM reliability.
- If that less than 1 in 5,000 deficiency were to occur it is unlikely to be due to a fuel supply emergency, as Rhodium Group data demonstrate, and unlikely to result in a customer outage due to system reliability tools at PJM's disposal.
- If the Commission goes forward with subsidizing certain resources for an unimportant quality like fuel supply on site, it should recognize important qualities like environmental/public health damage. Because coal generation causes environmental/public health damage averaging \$32/MWh according to the National Research Council, coal plants would be assessed \$32/MWh for their generation, subtracted from whatever revenues they otherwise receive.

For these reasons I respectfully request that the Commission not adopt the proposed rule.

Respectfully submitted,

/s/ Stephen L. Huntoon

Cash for Clunkers Redux

By Steve Huntoon

Remember the Cash for Clunkers program? Inefficient cars paid to go away.

The Energy Department's directive to FERC last week is Cash for Clunkers with a twist: inefficient generators paid to stay.

The original Cash for Clunkers was an economic stimulus for new stuff to replace the old stuff. The DOE's Notice of Proposed Rule-making subsidizes the old stuff to stop the new stuff: a sort of stimulus in reverse. (See related story, Perry Orders FERC Rescue of Nukes, Coal, p.1.)

So we might say the DOE version is a Twisted Sister sort of twist on the original.

Bailing Out the Retiring, Retired and Canceled Clunkers, and then Everyone Else

We know with certainty that the DOE proposal subsidizes the inefficient because those are the plants that will opt for the federal rate guarantee instead of market-based rates. How will this play out?

DOE says there are 34 GW in projected retirements over the next five years. Under the DOE proposal, none of that would retire and instead would go on the federal dole.

And then there's the 71 GW that already retired over the last six years but will likely return, like "Night of the Living Dead," for that federal rate guarantee.¹

And how about all those canceled nuclear projects?

So we'll have around 100+ GW of uneconomic clunkers crashing the markets, and of course crashing market prices. This will force all the economic plants that depend on legitimate market prices to join the federal dole.

Natural gas plants will do this by simply adding 90 days' worth of oil tanks.²

What will all this cost consumers? DOE doesn't even try to answer that question, but here's one way of looking at it. First, we can assume that FERC won't want thou-

Huntoon

sands of individual rate cases for all the power plants in all the RTOs.³

So FERC would need some sort of standard compensation. Let's say it adopts a cost of new generation, maybe \$400/MW-day.⁴ Generation in the RTOs is around 530 GW; add the roughly 70 GW of retired clunkers that will return from the dead, for about 600 GW on the federal dole. That's about \$88 billion annually.

So we are talking about tens of billions of dollars a year squandered first on what are, by definition, uneconomic resources, and then by paying economic resources that are rendered uneconomic by the clunkers and forced onto the same federal dole.

I can't help noting how Republicans blasted the original Cash for Clunkers,⁵ which had a one-time cost of \$3 billion. The DOE version is tens of billions of dollars every year, forever.

Resiliency

DOE says that its proposal is about "resiliency" (the new buzzword for reliability). But the retiring plants really are clunkers, as this PJM slide excerpt illustrates (I'll translate the jargon after the slide):⁶

Drop in Weighted Average EFORD Projected for 2021 is due to:

- Large amount of deactivations with high EFORD (7,150 MW with 14.56% Weighted Average EFORD).
- Large amount of additions with low EFORD (10,980 MW with 4.42% Weighted Average EFORD). Additions include only those queue projects that have executed an Interconnection Service Agreement.

| PJM

The deactivating (retiring) stuff has an outage rate — equivalent forced outage rate-demand (EFORD) — that is three times the new stuff (14.56% versus 4.42%). Yet DOE wants to subsidize these clunkers so they won't retire.

And that somehow is going to improve resiliency, again in a Twisted Sister sort of way.

90 Days of Fuel Supply on Site

A few words about the fuel supply require-

ment. DOE relies heavily on PJM's experience in the polar vortex of 2014 and claims that natural gas supply was the major problem. It was not. As this PJM chart plainly shows, natural gas interruptions affected 9,300 MW, accounting for less than 25% of total forced outages of 40,200 MW:⁷

| PJM

The FERC testimony of Mike Kormos, PJM's executive vice president at the time, directly contradicts DOE's main claim: "Natural gas interruptions removed less than 5% of the total capacity required to meet demand on Jan. 7, [2014], while equipment issues associated with both coal and natural gas units made up the far greater proportion of forced outages."⁸ (Emphasis added.)

Beyond equipment issues, another basic flaw in a metric like fuel supply on site is that coal piles freeze, as some did in the polar vortex. Years of coal supply on site would be worthless if frozen. And of course, nuclear plants can't run during refueling and other outages. Years of nuclear fuel on site would be worthless during those outages.

Here's a fun fact you won't find in the DOE NOPR: Baseload (combined cycle) natural gas plants average lower forced outage rates (4.29%) than baseload coal plants (7.71%), and have about the same as nuclear plants (3.51%).⁹ It's these overall forced outage rates that matter — not a single metric like fuel supply on site.

As for 90 days specifically, DOE provides zero rationale for that. In the polar vortex, the generation emergencies in PJM aggregated 20 hours.¹⁰ What is magic about 90 days (other than being tailored to the average coal plant stockpile)?

DOE-17-0427-B-001358

COUNTERFLOW

BY STEVE HUNTOON

Cash for Clunkers Redux

Continued from page 3

FERC and RTOs like PJM have learned from the polar vortex to reward performance and penalize nonperformance, instead of using a meaningless metric like days of fuel supply on site.

PJM hasn't had a single system generation emergency in more than three years — that's more than 26,280 hours of reliable operation. And PJM locks down adequate, reliable generation resources years in advance.

Bottom line: DOE proposes to take a system that is incredibly reliable and squander tens of billions of dollars on uneconomic resources to make it less reliable.

J&R Gone Missing

Absent from the DOE NOPR is an explanation of how its proposal would satisfy the lodestar requirement of the Federal Power

Act that all rates be just and reasonable.¹¹

Subsidizing uneconomic clunkers in organized markets is the antithesis of just and reasonable rates. It would be a repudiation of everything that FERC has sought to accomplish over the last 25 years.

Maybe Rick Perry was right all along: DOE should be abolished.

Steve Huntoon is a former president of the Energy Bar Association, with 30 years of experience advising and representing energy companies and institutions. He received a B.A. in economics and a J.D. from the University of Virginia. He is the principal in Energy Counsel, LLP, www.energy-counsel.com.

¹ If you're one of those owners, you might want to hold the wrecking ball. Or come to think of it, maybe you wouldn't: more rate base if you wreck and rebuild.

² The *Wall Street Journal* cites unidentified experts for the notion that on-yuclear and coal plants will qualify under the DOE proposal. That is wrong. Installing oil storage at natural gas plants is routinely done. Of course, if rate base becomes the game, LNG tanks would be used instead.

³ PJM alone has about a thousand generating units that do or could qualify for the federal rate guarantee. <http://pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2020-2021-rpm-resource-mode.ashx? a=en>.

⁴ There's a straight-faced argument for that: If new generation investment costs that much, existing generation should be compensated at the same level. Otherwise we would be incenting existing generation to retire that would cost less to keep around than paying for replacement new generation.

⁵ <https://www.seattletimes.com/nation-world/cash-for-clunkers-in-trouble-politics-or-prudence/>. "Senate Republican leaders rallied against the program Monday, calling it a mode of government inefficiency and out-of-control spending."

Anatomy of the New Cash for Clunkers

By Steve Huntoon

Those of us who dwell in the economic/regulatory/public policy realm wonder about the origins of atrocious public policy. Where did it come from? Whose awful idea was this?

In the case of the Department of Energy's Cash for Clunkers proposal, we pretty much know.

Robert Murray, owner of the coal mining company Murray Energy,¹ was a large fundraiser for candidate Donald Trump during the campaign.² After the election, Murray had a couple of meetings with President Trump at which the president promised Murray to do whatever he (and FirstEnergy) wanted Trump to do. I'm not making this up.³ (See excerpt, right.)

What Murray wanted was for Rick Perry, the secretary of energy, to declare an emergency on the electric grid so that FirstEnergy would keep buying a lot of coal from Murray's coal mining company. Again, I'm not making this up.

Now it seems that pesky government lawyers figured out that the supposed basis for such an action, Section 202(c) of the Federal Power Act, couldn't possibly justify that. "The White House and the Department of Energy are in agreement that the evidence does not warrant the use of this emergency action."⁴

At this point, a lot of us naively assumed it was safe to go back about our business. We were wrong.

Huntoon

Dear Mr. McEntee:

Last evening in Huntington, West Virginia, after President Donald Trump met briefly with Mr. Charles E. Jones, Chief Executive Officer of FirstEnergy Corporation, and the undersigned, he turned to you and said "teli Cohn to do whatever these two want him to do".

Somebody came up with Plan B (or more like Plan 9) of using an even more obscure federal statute to tell FERC to have a rulemaking to subsidize the coal and nuclear clunkers in the country. So here we are.

It's as simple and sad as that.

¹You may remember Robert Murray from the Crandall Canyon Mine collapse in which six miners and three rescuers perished, <http://www.nytimes.com/2008/05/09/us/08cnd-mine.htm>; <http://www.cnn.com/2008/US/07/24/mine.collapse/index.htm>.

More Smoking Guns for the Clunkers

By Steve Huntoon

My last coupé of co umns have explored the Department of Energy's "Cash for Clunkers" proposal. The first co umn discussed how it will cost tens of billions of dollars and subsidize less reliable generating resources to suppress more reliable resources.¹ The second co umn showed that the proposal is the direct result of meetings between President Trump and Robert Murray, coal mine owner and major fundraiser for the president's campaign,² not some deliberative process involving well-informed, well-intentioned people.

Huntoon

Robert Murray's Confirmation

A shout-out to Murray for providing a smoking gun one day after my last co umn ran, confirming that the DOE proposal is about selling more of his coal to FirstEnergy power plants, one way or another.³

1 in 5,000, and Then Some

Some folks may still think that the situation can't possibly be that outrageous. The DOE proposal can't be that devoid of merit.

Wrong.

The smoking gun below is from ReliabilityFirst, the regional reliability organization responsible for reliability in the Mid-Atlantic and Midwest states (the states that are the focus of the DOE

proposal).⁴

Please bear with me in explaining this graphic. It is displaying the winter. The leftmost co umn is showing generating resources. The next co umn is showing possible reduction in those resources due to resource outages, based on the last five winters (including the polar vortex). The percentages on the left are the chance of cumulative outages exceeding the associated outage quantity.⁵

The biggest cumulative reduction in resources has a 0.2% chance of occurring. That is one in 500.

OK, now skip the 50/50 Demand co umn and look at the 90/10 Demand co umn. That reflects a one-in-10 chance of the coldest weather.

Please note that resources at a one-in-500 worst case (the second co umn) are still much more than the peak demand in the one-in-10 worst case (the last co umn).

In other words, combined there is much less than a one-in-5,000 (500 x 10) chance of peak demand exceeding resources in the winter.

And there's more!

What if that less-than-one-in-5,000 situation were to occur? Fuel supply interruption is unlikely to be a major factor.⁶ And RTOs like PJM have too much to avoid customer impact, such as public appeals for conservation and voltage reductions.⁷ And any resource-demand shortage would last on only hours, not weeks or of course months.⁸

The DOE proposal is much ado about nothing.

The Worm Will Turn

Here's the third smoking gun. If FERC goes

forward with subsidizing certain resources for an insignificant quantity like fuel supply on site, it should recognize really important quantities like environmental/public health damage.⁹ In the case of coal, the National Research Council of the National Academies estimates that coal generation causes pollution damage averaging \$32/MWh.¹⁰

This means coal resources should pay \$32/MWh for their generation, to be subtracted from whatever revenues they otherwise would receive. The payments should be distributed to those hurt by coal generation.

This administration won't do that, but no administration is forever. Once the precedent is set for FERC to put its thumbs on the scales, coal better hope that the worm never turns.

Steve Huntoon is a former president of the Energy Bar Association, with 30 years of experience advising and representing energy companies and institutions. He received a B.A. in economics and a J.D. from the University of Virginia. He is the principal in Energy Counsel, LLP, www.energy-counsel.com.

¹ <http://ps://www.rtoinsider.com/erc-baseload-power-energy-department-doe-76332/>

² <http://ps://www.rtoinsider.com/murray-energy-department-doe-energy-76903/>

³ Murray said he had pressed Trump and Energy Secretary Rick Perry to have the secretary order financial support for a risk coal plant using DOE emergency authority, but the department and White House lawyers ruled against him. "They didn't want to declare the emergency," he said. "It was a low point because we worked hard at it and knew it was needed."

"They're doing it in a different way," Murray said. "Now we have another approach that is in use on the same point." <http://ps://www.eenews.net/energywire/2017/10/11/stories/1060063287>

⁴ <http://ps://www.rfrs.org/reliability/Documents/2016-17%20RF%20Assessment-Winter%20Resource.pdf>

⁵ ReliabilityFirst says, "To help side on the range of random outages are probability percentages related to the amount of random outages that equal or exceed the amount of outages shown above the line on the outage bar."

⁶ "Between 2012 and 2016, there were roughly 3.4 billion customer-hours impacted by major electricity disruptions. Of that, 2,382 hours, or 0.00007% of the total, was due to fuel supply problems." <http://ps://rthg.com/news/he-real-electricity-reliability-crisis>

⁷ Described in excruciating detail in PJM's Manual 13, <http://ps://pjm.com/-/media/documents/manuals/m13.ashx>

⁸ In the polar vortex, the generation emergencies in PJM aggregated 20 hours. http://ps://pjm.com/-/media/committees-groups/committees/elc/pos/pos_insp/performance-assessment-hours-2011-2014.xls.ashx?la=en

⁹ An elaborate and persuasive discussion of this proposal is provided by Professors Meredith Fowle and Maximilian Auffhammer: <http://ps://theconversation.com/why-rick-perry-proposed-subsidies-for-coal-all-economics-101-83339>

¹⁰ <http://ps://www.nap.edu/catalog/12794/hidden-costs-of-energy-unpriced-consequences-of-energy-production-and-consumption> (page 92, converting from kilowatt-hours to megawatt-hours). Damage from natural gas pollution is \$1.60/MWh (page 118). Damage from nuclear pollution is small (page 150). These figures do not include greenhouse gases.

COMMENTS OF THE BIPARTISAN FORMER FERC COMMISSIONERS

WHO WE ARE AND WHY WE CARE

The Commission's mission is to "assist consumers in obtaining reliable, efficient and sustainable energy services at a reasonable cost through appropriate regulatory and market means."¹ Over the last twenty-five years the Commission has advanced that mission by enabling competitive wholesale markets to promote lower costs and greater efficiencies in the electric utility sector, just as it did in the natural gas sector. Our² common

Santa, Jr., Commissioner, 1993-1997; Linda Key Breathitt, Commissioner 1997-2002; Pat Wood, III, Chairman 2001-2005; Nora Mead Brownell, Commissioner 2001-2006; Joseph T. Kelliher; Commissioner 2003-2009, Chairman 2005-2009; Jon Wellinghoff, Commissioner 2006-2013, Chairman 2009-2013 ("the Bipartisan Former FERC Commissioners"). We were appointed to the Commission by every President since Ronald Reagan.

goal has been to encourage competition in the electricity sector in order to benefit customers, enhance reliability and facilitate construction of the infrastructure necessary to allow our great nation to grow and prosper.

Over this quarter century, we have each been intimately involved in leading this effort to achieve efficient, reliable energy service through market forces. We believed – with conviction borne of experience -- that requiring nondiscriminatory access to the nation’s electric transmission grids, and fostering open, wholesale competitive markets for the sale of electricity over those grids is the most cost-effective way to deliver energy services to customers, and is therefore in the public interest. Order No. 888, establishing transmission open access, and Order No. 2000, defining the responsibilities of regional transmission organizations (RTOs) are the key mileposts of this era. In addition, we issued hundreds of orders and adopted numerous other rules providing detailed guidance to these markets as they developed. We substantially expanded our market oversight and enforcement capabilities to protect customers from market fraud and abuse. And with those expanded capabilities we engaged in numerous significant enforcement actions to maintain order in these markets and protect customers’ interests. We also worked

tirelessly with market participants and state regulators to achieve balance in our decisions. This shared collaborative mission across party lines and Presidential Administrations has been a model of good government.

This effort to develop organized markets has been successful by almost any measure, reaching over two-thirds of all customers in the nation's economy. Widely diverse interests have invested tens of billions of dollars in both competitive and regulated infrastructure. Customers and the industry have benefitted from lower costs and better, more reliable services. Technological innovation has swept the entire value chain. The Commission's initiative has been supported by virtually all of the participants in this vitally important sector of our economy. It has drawn support from officials in every Presidential Administration over the last three decades, from every relevant committee of the Congress, and from courts at all levels of the Judiciary, including landmark opinions by the United States Supreme Court upholding the Commission's key orders.

OUR VIEW OF THE PROPOSAL

The published proposal in this Docket would be a significant step backward from the Commission's long and bipartisan

evolution to transparent, open, competitive wholesale markets. Pursuing the worthy goal of a resilient power system, the Commission's adoption of the published proposal would instead disrupt decades of substantial investment made in the modern electric power system, raise costs for customers, and do so in a manner directly counter to the Commission's long experience.

In the competitive wholesale markets, many states have elected to separate historic utility-owned power generating facilities from regulated operations, much as the Commission did with natural gas production operations and natural gas pipeline companies in the preceding decade. In the power sector, these separation proceedings were often contentious, and eventually gave rise to many billions of dollars of utility cost recovery for the excess book cost of generating plant over the then-market cost ("stranded costs"). Varying transition periods were set to recover those costs and make the utilities whole for their historic plant investments. It is a subset of these power plants that are the focus of this inquiry.

One critical aspect of competitive wholesale markets is that the risk of these generation investments has been shifted away from captive customers to market participants who could better manage risk (and some who have not been successful doing so).

Another achievement is that competitive wholesale markets have delivered lower-cost electric power and improved the efficiency of the generation fleet. And not just of the original power plants. This revolution stimulated tens of billions of dollars of investment in newer and cleaner power technologies, more efficient plant operations, competitive fuel procurement, efficient dispatch over large regions, more restrained prices, and more competitive (lower) margins. Power prices have tracked fuel prices, particularly that of natural gas, which is, in most hours and in most markets, the marginal unit fuel. New entrants to the competitive wholesale marketplace have included combined-cycle natural gas plants, renewable energy technologies, storage, distributed generation and demand response. It was entirely foreseeable that competition and technological innovation would result in the exit of high-cost generators. Wholesale competition, indeed, has forced existing resources to become more reliable or to exit the market, and many noncompetitive generating units have exited.³

³ This is not just a feature of competitive wholesale markets. Over half of the retirements of coal, gas and nuclear plants since 2002 have been from regulated status. A map depicting these retirements is shown on the Department of Energy's web page introducing the 2017 Staff Report to the Secretary on Electricity Markets and Reliability at <https://energy.gov/downloads/download-staff-report-secretary-electricity-markets-and-reliability>. It is also found in the Staff Report at page 15.

The independent RTOs that have developed under Order No. 2000 have done a superb job operating the transmission networks and managing markets reliably, safely and efficiently for all wholesale power customers. These new independently-run wholesale markets have also enabled retail customer choice programs across the country, most notably in the states that are most impacted by this inquiry.

The RTOs operate open, transparent markets. The least-cost resources for energy for every hour (accounting for reliability needs and transmission constraints) are purchased. In those RTOs with capacity markets, the least-cost resources for capacity (accounting for transmission constraints) are purchased. Those resources which fail to recover sufficient revenues from these markets, or otherwise from their customers, retire.

Subsidizing resources so they do not retire would fundamentally distort markets. The subsidized resources would inevitably drive out the unsubsidized resources, and the subsidies would inevitably raise prices to customers. Investor confidence would evaporate and markets would tend to collapse. This loss of faith in markets would thereby undermine reliability.

The Commission has always been fuel-agnostic, refraining from favoring one fuel over another. This is, in part, out of

recognition that the last federal effort to do that was quickly shown to be a grossly uneconomic mistake.⁴ We acknowledge that the markets today are not pristine; various kinds of external supports for resources still exist. Federal tax subsidies for wind and solar generation have been approved by Congress, as were less overt benefits for oil, gas and coal extraction. The states of New York and Illinois have also recently moved into this arena with the adoption of subsidies for certain nuclear plants. The Commission cannot ignore these interventions, and in fact, should actively inform legislators how such programs impact market operations. But one step the Commission has never taken is to create or authorize on its own the kind of subsidy proposed here.

We know there is always more to do to make wholesale markets more open, more transparent and more efficient; but moving backward is not the way to go. We strongly encourage the Commission to use this opportunity created by the Secretary to identify attributes of the current competitive market system that need to be improved, to crisply define them and either modify the current published proposal or initiate regional proceedings to examine resilience issues and consider the need for market rule changes.

⁴ The Powerplant and Industrial Fuel Use Act of 1978, repealed in 1987.

Several examples follow. All organized markets procure Black Start resources for restoring a power station or a part of the grid without reliance on external power. These procurement methods range from cost-of-service based tariffs in some of the RTOs to a fully competitive process used in ERCOT outside of FERC's jurisdiction. An outcome-based resiliency service could follow a similar pattern, to the extent current ancillary services are not providing it adequately.

Similarly, Reliability Must-Run (RMR) arrangements have been adopted by the RTOs to ensure that a specific resource, which would otherwise be mothballed or retired, remains available for a specified length of time to provide a base level of energy production needed for local reliability. A cost-based formula is often used to calculate the compensation for the affected unit, and the cost is uplifted to the broader RTO market. The RTOs and the Commission are well aware of the negative impact such out-of-market interventions can have on the marketplace. For that reason, RMR contracts have been used relatively sparingly and to address well-defined, limited local reliability challenges that the market could not address in the short term.

The issues of reliability and resiliency are not new to the Commission. These issues are more likely to be related to utility transmission and distribution systems;⁵ after an emergency, it is the power delivery system recovery timeline that drives the restoration of retail service. To be sure, a more robust transmission and distribution system will add resilience in all markets. While there have been some instances of generation-related customer outages,⁶ fuel supply emergencies have been an insignificant cause of customer outages. To the extent these could become an issue, there are market-based solutions that can be employed; for example, the recently-implemented capacity performance programs in PJM and ISO-NE are intended to incent and reward fuel supply certainty, and to severely penalize the failure to provide power at critical times.

⁵ A memorable example of a power delivery failure, the 2003 Northeastern North American Blackout, originated in Ohio when inadequate vegetation management by a transmission-owning utility triggered multiple transmission outages on a summer afternoon and the tripping of a coal-fired power plant in Cleveland. These incidents, combined with inadequate situational awareness across the region, led to cascading failures across northeastern North America, and over fifty million people were out of power, some for up to seven days. The FERC Staff summary of this incident is found at:

<https://www.ferc.gov/CalendarFiles/20040915141105-blackout.pdf>

⁶ See, e.g., <https://www.ferc.gov/legal/staff-reports/08-16-11-report.pdf> regarding a February 2011 cold weather event in Texas and the Southwest. And the causes of the 2000-2001 power outages in California are well known to the Commission (and to these commenters).

In our years of service on the Commission, we all leaned heavily on the use of broad stakeholder processes in the organized markets to develop balanced rules for all to live under, and we remain supportive of the checks and balances such mechanisms provide. To the extent, however, these processes are unable to address the reliability and/or resilience issues raised in this Docket, the independent Boards of the organized markets should be able to file directly for Commission approval of such changes. That is a principal reason why we insisted in Order No. 2000 on such independent governance.

CONCLUSION

In the end, it is the Commission that has statutory responsibility for just and reasonable rates and for maintaining reliability. This is an extremely challenging responsibility shared by five independent Commissioners and a dedicated staff. We therefore urge the Commission to actively defend and promote reliable, competitive energy markets in all arenas. The injection of uncertainty over the future of efficient, competitive electric markets and the highly capital-intensive and vitally important electric industry impairs critical long-term investment and jeopardizes the delivery of cost-effective energy services to

customers.

Accordingly, we urge you not to move forward with the published proposal, and instead address the issues of power system reliability and resiliency consistent with the Commission's long history and in the transparent, bipartisan, policy-centered manner for which this Commission has long been respected.

Respectfully submitted,

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

Grid Reliability and Resilience Pricing) Docket No. RM18-1-000

**INITIAL COMMENTS OF PJM INTERCONNECTION, L.L.C.
ON THE UNITED STATES DEPARTMENT OF ENERGY PROPOSED RULE**

PJM Interconnection, L.L.C. (“PJM”) hereby submits its initial comments on the Notice of Proposed Rulemaking submitted to the Commission by the Secretary of the United States. Department of Energy (“DOE”) on September 28, 2017, as revised upon publication in the Federal Register on October 10, 2017 (“DOE NOPR”).¹ To assist the Commission’s evaluation of the DOE NOPR, PJM also responds, in Appendix A to these comments, to the questions posed in the Commission’s October 4, 2017 request for information relevant to the DOE NOPR.

I. INTRODUCTION

As shown in these Comments, the DOE NOPR is well wide of the mark both in its statement of the problem it seeks to address and in its identification of a reasonable remedy. Accordingly, PJM believes that a prudent path for the Commission should include: (a) re-focusing from the DOE NOPR's broad-brush concern with changes in the resource mix to a deeper, more meaningful, and more productive consideration of how resource mix changes are affecting each individual Regional Transmission Organization

¹ The Secretary proposed the rule pursuant to section 403 of the Department of Energy Organization Act, 42 U.S.C. § 7173. *See* Grid Resiliency Pricing Rule, 82 Fed. Reg. 46,940 (proposed Oct. 10, 2017). The Commission noticed the proposed rule on October 2, 2017, seeking initial comments by October 23, 2017, and reply comments by November 7, 2017. *See* *Grid Reliability and Resilience Pricing*, Notice Inviting Comments, Docket No. RM18-1-000 (Oct. 2, 2017).

(“RTO”) markets, operations, and reliability and (b) directing the submission of regional solutions, as needed, subject to a filing deadline, that are more in line with the actual history and experience of each RTO given its particular resource mix, and operational and reliability needs. Through these comments, PJM will demonstrate:

- The lack of support, both legally and factually, for the DOE NOPR’s identification of the stated problem;
- The legal and factual infirmities associated with the DOE’s proposed cost of service remedy;
- How the problem identified by the DOE can be restated to more accurately reflect price formation issues that are in line with historic RTO experience; and
- An alternative path promising solutions that allow for regional flexibility while responding to the direction called for in the DOE Staff’s August 2017 Report² to examine correct price formation in organized electricity markets.

Accordingly, PJM urges the Commission to find that the DOE NOPR, although referencing certain legitimate findings made in the DOE Staff Report, does not correctly state the problem nor propose a reasonable solution that meets the just and reasonable standard under the Federal Power Act (“FPA”).³ As shown in these Comments, the DOE NOPR takes observations about overall changes in the resource mix across the nation as the basis for a sweeping and unsupported conclusion that, solely in regions with capacity and energy markets, certain units, regardless of their location, performance history, or competitiveness, deserve full cost recovery through out-of-market mechanisms.

² *Staff Report to the Secretary on Electricity Markets and Reliability*, U.S. Department of Energy (Aug. 17, 2017) (“DOE Staff Report”).

³ 16 U.S.C. § 824e.

Specifically, the DOE NOPR:

- Is inconsistent with very recent findings and recommendations published by the DOE on the subjects of fuel security, grid resilience and RTO market price formation;
- Does not meet basic standards of reasoned decision-making—the claimed facts do not lead to the proposed remedy;
- Contradicts the plain fact that reliability generally has been well-served in regions with capacity and energy markets;
- Would represent a radical departure from years of Commission approval of single-clearing price markets;
- Would undermine reliability and lead to substantially higher costs and economic inefficiencies;
- Contradicts Congressional endorsement of the Commission’s increased reliance on competitive markets;
- Intrudes on state resource choices, include choices to rely on RTO-administered competitive markets;
- Creates distortions in investment decisions that will exacerbate seams issues and actually harm rather than enhance system reliability;
- Attempts to impose blanket, guaranteed cost recovery for numerous resources in a manner flatly contradictory to long-standing, fundamental rate-making requirements under the FPA; and
- Violates the FPA’s prohibition on undue discrimination.

Given coal-fired and nuclear generators comprise just over fifty percent of all currently installed generation capacity in the PJM region,⁴ if the DOE NOPR were adopted, it would remove half of all the capacity in the PJM region from the discipline of competitive market forces. Even accepting the nature and degree of the DOE’s concerns,

⁴ See PJM Interconnection, L.L.C., <http://www.pjm.com/~media/markets-ops/ops-analysis/capacity-by-fuel-type-2016.ashx> (last visited Oct. 27, 2017) (showing nuclear and coal as a combined 53% of the resource mix).

its NOPR fails to consider the most obvious alternative. Assuming there is a shortcoming in capacity and energy markets, the *first* response should be to fix such a shortcoming, which is to say, evaluate structural market changes that better define and value resources' operational and reliability attributes *within the market rather than upending market principles in their entirety*.

As noted above, PJM believes a better identification of the underlying concern, as well as PJM's proposed procedural pathway, is far more appropriate given the legal and practical infirmities of the DOE NOPR as proposed. For its part, PJM has seen changes in the workings of its market traceable to resource mix changes and other industry changes over recent periods. Those observed changes raise clear concerns about market price formation under current rules, including treatment of fast-start resources, recognition of inflexible resources in clearing prices, shortage pricing, and resource characteristics and attributes that currently are not, but should be, identified and valued in the market. In these Comments, PJM describes those observed impacts, and clearly shows the concerns those impacts raise.

In section III herein, PJM explains why reforms are needed in PJM now to ensure that (i) the cost of serving load is reflected in LMP to the fullest extent possible, (ii) uplift is reduced, and (iii) proper economic incentives are maintained. Enhanced energy market price signals will strengthen performance incentives in PJM's markets and is in line with other reforms being considered by PJM. The Commission should act now to ensure that essential reliability services that resources provide are maintained. PJM understands not all regions face the same need for action. An extensive record has been developed to date in this area in the Commission's price formation proceedings, as confirmed by the August

DOE Report. Thus, to move forward, the Commission should direct each RTO/ISO to identify for the Commission whether changes in the resource mix has created issues in their respective regions that are currently not addressed in the market. If any issues exist, the RTO/ISO should prioritize the issues of most consequence to that region and provide, within a Commission-specified deadline that is in the near term, for the submission of proposals, if necessary.⁵ In the alternative, the Commission could expand the scope of its existing open price formation NOPRs to provide for regional solutions around the issues it has broadly identified in those dockets.

II. COMMENTS

A. **The DOE NOPR Incorrectly Identifies a Perceived Problem and Its Cause, and Seeks to Impose a Remedy That Is Not Supported by the Reliability and Resilience Concerns the DOE NOPR Claims to Address**

The DOE NOPR misidentifies a problem, misstates the cause, and then proposes a radical solution that is antithetical to clear Congressional and Commission policy in favor of promoting competitive energy markets. The DOE NOPR assumes without support that there is a resilience crisis that is urgently unfolding because coal and nuclear units are retiring, that market prices are to blame, and that the only solution is to incentivize those coal and nuclear units to remain in service by providing them with guaranteed cost of service rate recovery regardless of whether they are needed for resilience or actually provide measurable resilience benefits. The DOE NOPR does this to the detriment of competitive markets.

⁵ The Commission could require that, to the extent an ISO/RTO identifies no changes are necessary for its region, the ISO/RTO would be required to submit a report to the Commission within that time frame, in place of a tariff proposal.

Given its scope and applicability, the DOE NOPR is a transparent attack on those RTOs and ISOs that operate capacity markets generally⁶—and possibly PJM specifically⁷—without any showing that the misidentified problem exists in PJM or those other markets and exists exclusively in those markets. While claiming to address an imminent threat to the “resilience” of the electric grid from looming retirement of so-called “fuel-secure” baseload resources, the DOE NOPR fails to demonstrate that any such threat is imminent, that retirements are to blame, that competitive markets and specifically capacity markets are forcing retirements that would not have otherwise occurred, or that its proposed solution will actually address the perceived problem. The DOE NOPR’s compensation mandate is wholly unjustified and the Commission should reject it.

The DOE NOPR conflates resilience with reliability. The DOE NOPR does not explain how maintaining a 90-day supply of fuel will enable quick restoration of service following a catastrophic grid event, which is a cornerstone concept of resilience. Instead, the proposal seeks to keep coal and nuclear units online all the time as baseload resources, indicating the DOE NOPR’s concern is reliability, not resilience. The DOE NOPR proposes to maintain otherwise uneconomic coal and nuclear units by affording them cost of service rate recovery, enabling them to offer into the markets at unrealistically low prices, clear, and operate continuously as “baseload.” While secure fuel and a robust resource mix contribute to both reliability and resilience, the DOE

⁶ As the publication of the DOE NOPR in the Federal Register makes plain, *capacity markets* are the sole target of the DOE NOPR’s mandates. See DOE NOPR at 46,944.

⁷ Notably, PJM is the only RTO mentioned in the DOE NOPR.

NOPR fails to show that acquiring 90 days' worth of fuel, and rewarding those units that are able to do so, is necessary to ensure either reliability or resilience.

In fact, the DOE NOPR provides no definition of resilience at all, and further fails by neglecting to identify any performance standards or metrics to evaluate the resilience characteristics, effectiveness, and performance of various resource types. In place of such standards, the DOE NOPR establishes blanket eligibility for any resource that participates in competitive energy markets outside of retail cost of service rate regulation, satisfies an arbitrary 90-day fuel supply requirement, and satisfies other minimum characteristics, regardless of whether the resource is needed to provide reliability or resilience services to the grid.

In short, the DOE NOPR's identification of the perceived problem is not correct, and its proposed imposition of cost of service pricing will not only fail to fix the perceived problem but will have severe adverse effects on competitive markets that the Commission and RTOs like PJM have labored for decades to develop.

1. The Facts and Sources Cited by the DOE NOPR Do Not Support Its Findings or Proposal

Rather than attempting to offer concrete evidence of a looming resilience crisis caused by mass retirement of coal and nuclear units that can only be fixed by destroying competitive markets, the DOE NOPR relies on hollow assertions that the resilience of the nation's electric grid is imminently threatened by premature retirement of so-called fuel-secure baseload resources⁸ and self-evident observations like winter is coming.⁹ The DOE NOPR provides no justification for imposing onto competitive energy markets a

⁸ DOE NOPR at 46,941.

⁹ DOE NOPR at 46,945 (urging the Commission to "take action before the winter heating season begins").

large new out-of-market cost burden for certain select generation resources, and certainly no compelling explanation of why such action is urgently needed to stave off an imminent crisis.

The thin reed upon which the DOE NOPR's call for urgency and its proposed remedy is built is the notion that generation resource retirements are occurring and unusual weather events have presented challenges to grid operators in the past few years. Specifically, the DOE NOPR cites select discussion from the January 2017 Quadrennial Energy Review¹⁰ and the recent DOE Staff Report regarding recent and anticipated future retirements of coal and nuclear units and weather anomalies such as the 2014 Polar Vortex.¹¹ None of these sources, however, support the DOE NOPR's radical replacement of competitive markets with federal cost of service ratemaking for certain favored generators. And in fact, PJM's system remained reliable despite nearly 14,000 MW of coal retirements in the recent past due in part to changing environmental rules. The unusually high unforced outage rate during the Polar Vortex has been mitigated—as can be seen in Figure 1—through various measures, including PJM's Capacity Performance reforms and steps it has taken for winter preparedness, discussed herein and in PJM's responses to OEPI's questions in Appendix A hereto.

¹⁰ Quadrennial Energy Review, *Transforming the Nation's Electricity System: the Second Installment of the Quadrennial Energy Review*, Department of Energy (Jan. 2017), [https://energy.gov/sites/prod/files/2017/02/f34/Quadrennial%20Energy%20Review--Second%20Installment%20\(Full%20Report\).pdf](https://energy.gov/sites/prod/files/2017/02/f34/Quadrennial%20Energy%20Review--Second%20Installment%20(Full%20Report).pdf).

¹¹ DOE NOPR at 46,942.

Figure 1: Weighted-Average EFORD Projected for DY

The drop in Weighted Average EFORD projected for 2021 is due to:

- Large amount of deactivations with high EFORD (7,150 MW with 14.56% Weighted Average EFORD)
- Large amount of additions with low EFORD (16,980 MW with 4.42% Weighted Average EFORD). Additions include only those queue projects that had executed an ISA by April 17, 2017.

The DOE NOPR appears to blame competitive market pricing and rules as the sole or primary impetus for retirement of coal and nuclear units. However, the DOE NOPR paints an incomplete picture of the findings and conclusions on which it relies. Notably, the DOE Staff Report identifies many factors contributing to retirements, including, among other things, the age of the plants in question,¹² state public policy

¹² E.g., DOE Staff Report at 22 (“The age of coal plants is an important factor . . . [T]he vast majority of coal-fired capacity was built before 1990, with the average of the fleet built in the mid to late 1970s.”) (emphasis added); *id.* (“According to the Congressional Research Service, the service life of coal-fired generators reportedly ‘averages between 35 and 50 years . . .’” (quoting Richard J. Campbell, *Increasing the Efficiency of Existing Coal-Fired Power Plants*, Congressional Research Service, 6 (Dec. 20, 2013), <https://fas.org/sgp/crs/misc/R43343.pdf>)); DOE Staff Report at 21 (“Most coal-fired capacity (88%) was built between 1950 and 1990, and the capacity-weighted average age of operating coal facilities is 39 years.” (citing Scott Jell, *Most Coal Plants in the United States Were Built Before 1990*, Energy

decisions,¹³ federal environmental requirements,¹⁴ and more cost-effective alternative fuels.¹⁵ While the DOE NOPR also suggests that the retirements it identifies are “premature,”¹⁶ it provides no analysis of whether such retirements truly have occurred prior to the end of the useful lifecycle of the resources in question, further eroding evidentiary support for the DOE NOPR’s costly compensation mandate. While RTOs are examining whether market price formation rules could be revised to recognize the reliability and resilience values brought by a diversity of resource types,¹⁷ the DOE Staff Report provides no evidentiary basis to conclude that market prices are the sole or even primary cause of coal and nuclear retirements. Subsidizing such favored units will not

Information Administration (Apr. 17, 2017), <https://www.eia.gov/todayinenergy/detail.php?id=30812>); DOE Staff Report at 23 (“Retired plants are older than the remaining fleet. The coal units that retired in 2015 were mainly built between 1950 and 1970, and the average age of those retired units was 54 years.”).

¹³ *E.g.*, DOE Staff Report at 16 (“Some of the nuclear units now closing are doing so because of state pressure (as with California’s Diablo Canyon, New Jersey’s Oyster Creek, and New York’s Indian Point)”)

¹⁴ *E.g.*, DOE Staff Report at 17 (“Figure 3.3 shows that a significant amount of capacity (the highest on record) retired in 2015, *coinciding with the [Mercury and Air Toxics Standards (“MATS”)] compliance deadline*, which applied to coal- and oil-fired units across the country, as well as the finalization of the *Clean Power Plan rule*.”) (emphasis added); *id.* at 19 (“The compliance deadline for MATS converged with tightening pollution limits in sulfur dioxide (SO₂) and nitrogen oxide (NO_x) trading programs. *Many of the coal and oil retirements in this period were plants whose owners chose to shut down a plant rather than invest in costly environmental remediation measures.*”) (emphasis added); *id.* at 24 (“Most of the power plants being closed today were built in the 1940s to 1960s, *before the Clean Air Act was passed in 1970*. Many have minimal air pollution controls Many closures coincided with the MATS deadlines in 2015 and 2016” (emphasis added) (quoting Ed Malley, *Coal Power Plant Post-Retirement Options*, POWER (Sept. 1, 2016), <http://www.powermag.com/coal-power-plant-post-retirement-options/>)).

¹⁵ *E.g.*, DOE Staff Report at 24 (“The increase in natural gas generation since 2005 is primarily a result of the continued cost-competitiveness of natural gas relative to coal.” (quoting Augustine Kwon, *Natural Gas Generation Make Up the Largest Share of Overall U.S. Generation Capacity*, Energy Information Administration (Apr. 20, 2017), <https://www.eia.gov/todayinenergy/detail.php?id=30872>)).

¹⁷ *See infra* Section A(3).

ward off other externalities that the DOE's own staff has identified as contributing to plant retirements.

Similarly, the 2017 QER Report provides no basis to conclude that there is an imminent resilience emergency that can best be solved by distorting competitive markets through imposition of cost of service rate recovery for coal and nuclear resources. Quite the contrary, in its recommendations on "Grid Operations and Planning for Electricity System Reliability, Security and Resilience," the 2017 QER Report recommends such initiatives as (among others): (1) providing incentives for energy storage; (2) improving data for grid security and resilience; (3) requiring states to consider the value of distributed energy resources; (4) enhancing coordination among the industry; (5) encouraging cost effective use of advanced technologies that improve transmission operations; and (6) improving data, monitoring, and analysis capabilities.¹⁸ Absent from the 2017 QER Report's list of resilience recommendations is anything resembling the DOE NOPR's proposal to subsidize aging and inefficient generation units to the detriment of competitive markets.

Likewise mischaracterized and misconstrued are the recent extreme weather events upon which the DOE NOPR relies. Contrary to the DOE NOPR, neither the 2014 Polar Vortex nor the recent hurricanes justify upending existing competitive energy markets. Indeed, as the DOE Staff Report acknowledges, during the Polar Vortex, "[m]any coal plants could not operate due to conveyor belts and coal piles freezing."¹⁹

¹⁸ 2017 QER Report at S-25–S-26.

¹⁹ DOE Staff Report at 98. The DOE Staff Report also concluded that "[w]hile coal facilities typically store enough fuel onsite to last for 30 days or more, extreme cold can lead to frozen fuel stockpiles and disruption in train deliveries." *Id.* at 11-12.

While fuel delivery was an issue during the Polar Vortex, it was not the driving factor behind outages that occurred during the extreme weather event, nor was gas-fired generation the villain, nor coal and nuclear the savior, that the DOE NOPR suggests them to be. Specifically, during the Polar Vortex, of the approximately 40,200 MW of forced generator outages in PJM, coal steam outages (considering all sources of failure) were the largest outage category, at 13,700 MW (representing 34% of the outages), and nuclear outages totaled 1,400 MW.²⁰ Having a 90-day fuel supply would not have cured these outages, for it was not a lack of fuel that caused them. Additionally, as PJM has explained, all resource types, except for wind and demand response, performed sub optimally during the extreme weather event:

At the time of the peak demand hour on January 7, approximately 22 percent of total installed generation capacity in PJM (of all fuel types) was unavailable because of forced outages associated with routine equipment breakdowns, *problems related to operating in extreme cold temperatures* and, fuel-supply issues. Although there has been much focus on gas issues associated with interruptible transportation, *overall the gas interruptions were not the major driver of the high forced outage rates* experienced in the PJM region. *Natural gas interruptions, although significant, removed less than five percent of the total capacity* required to meet demand on January 7, *while equipment issues associated with both coal and natural gas units made up the far greater proportion of forced outages.*²¹

Notwithstanding these significant challenges, as the DOE Staff Report explains, PJM and other “grid operators generally met demand, even under these severe conditions.”²² Fuel

²⁰ *Analysis of Operational Events and Market Impacts During the January 2014 Cold Weather Events*, PJM Interconnection, L.L.C., 26 (May 8, 2014), <http://www.pjm.com/~media/library/reports-notice/weather-related/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx>.

²¹ Post-Technical Conference Comments of PJM Interconnection, L.L.C., Docket No. AD14-8-000, at Appendix 1 (Statement of Michael J. Kormos Executive Vice President – Operations, PJM Interconnection, L.L.C. at 3-4) (May 15, 2014) (“Kormos Statement”) (*emphasis added*).

²² DOE Staff Report at 98.

supply was not the sole or even primary issue affecting grid operations during the Polar Vortex, and compensating *all* qualified “fuel-secure” generators for maintaining a 90-day fuel supply would not have made a significant difference in addressing the impacts of the Polar Vortex.

Likewise, the DOE NOPR’s reliance on Superstorm Sandy and recent hurricanes also fails to justify its radical cost of service subsidy scheme. As an initial matter, in high wind events like hurricanes, it is often the distribution and, to a lesser degree, transmission system that are most impacted. For example, as NERC notes in its assessment of Superstorm Sandy, 16,738 MW of fossil fuel generation became unavailable during the storm, which “did not result in any capacity issues,” “[b]ecause of the amount of load preemptively *off or unavailable to the distribution system.*”²³ NERC also noted that “[w]hile there was sufficient generation capacity available to meet the load as restoration progressed, there were some cases where customer restoration was hindered by *local area transmission outages.*”²⁴ In other words, even though generating power was available to serve customers, power line damage prevented it from being delivered to many customers experiencing service outages. Having 90 days’ worth of fuel onsite does nothing to counteract the impact of distribution or transmission infrastructure damage that is often the cause of customer service outages during a hurricane or similar event.

²³ *Hurricane Sandy Event Analysis Report*, NERC, 22 (Jan. 2014), http://www.nerc.com/pa/rrm/ea/Oct2012HurricaneSandyEvtAnlyssRprtDL/Hurricane_Sandy_EAR_20140312_Final.pdf (“NERC Hurricane Sandy Report”) (emphasis added).

²⁴ *Hurricane Sandy Event Analysis Report*, NERC, 22 (Jan. 2014) at 5 (emphasis added).

The evidence and events that the DOE NOPR cites do not support its assertion of a resilience crisis or its rationale for degrading competitive markets in the name of fuel resilience. As experience during extreme weather events has shown, myriad factors contribute to outages, and fuel security, while beneficial, provides no guarantee of resilience during such events. Given the paucity of evidence to support its expensive and anticompetitive cost of service guarantee, the DOE NOPR appears aimed less at truly addressing resilience concerns and more at benefitting certain preferred generators and fuels and the industries they support.

2. The PJM Region Is Reliable, and PJM's Competitive Markets Have Been Instrumental in Helping Ensure that Reliability.

As explained above, the DOE NOPR offers nothing to show that market regions in general, or the PJM Region in particular, is in any danger of failing to meet reliability or resource adequacy requirements now or in the future. This is not surprising, as the PJM Region unquestionably is reliable, and its competitive markets have for years secured commitments from capacity resources that well exceed the target reserve margin established to meet NERC requirements. And the PJM capacity market also includes rigorous performance requirements, enforced by market mechanisms—which were affirmed just this year by a U.S. Court of Appeals.²⁵

First, contrary to suggestions that the DOE NOPR changes are needed to “keep[] the lights on,”²⁶ PJM’s capacity market has consistently secured Capacity Resources above and beyond the level needed to meet the NERC standard of no more than one

²⁵ *Advanced Energy Mgmt. All. v. FERC*, 860 F.3d 656 (D.C. Cir. 2017).

expected loss-of-load event every ten years. For the next three Delivery Years (extending through May 31, 2021), the Base Residual Auctions resulted in reserve margins of 19.8% (2018/2019 DY), 22.4% (2019/2020 DY), and 23.3 % (2020/2021 DY).²⁷ These reserve margins are about four to six percentage points above the level needed to meet the NERC loss-of-load-expectation criteria.²⁸ These auctions also have elicited significant investments in new generation, at competitive costs generally below administrative estimates of the cost of new entry.²⁹ Notably, the capacity committed to the PJM Region through 2021 (and entitled to receive capacity revenues for at least that long) include coal and nuclear plants (of all ages) in megawatt amounts that rival or exceed the capacity base for those two plant types seen in any other region in the continental U.S.³⁰

Second, even looking past aggregate resource commitments to consider reliability of the resource mix, PJM's initial rigorous analysis of that issue earlier this year³¹ yielded encouraging results, and found no immediate (or even near-term) emergencies.³² PJM assessed future likely and plausible generation resource mix portfolios on their ability to provide certain essential reliability services, including frequency response, voltage control, ramp, fuel assurance, flexibility, black start, environmental restrictions, and

²⁷ *2020/2021 PJM Base Residual Auction Results*, PJM Interconnection, L.L.C., 6 tbl. 1 (May 23, 2017), <http://www.pjm.com/~media/markets-ops/rpm/rpm-auction-info/2020-2021-base-residual-auction-report.ashx?la=en>.

³² *Id.* at 4-5.

equivalent availability factor.³³ PJM also tested those possible future portfolios using both a standard loss-of-load analysis, and an adjusted analysis that accounted for the potential added load-loss risk of heavy reliance on intermittent resources. PJM found that “the expected near-term resource portfolio is among the highest-performing portfolios and is well-equipped to provide the generator reliability attributes.”³⁴ That expected near-term portfolio is for 2021, taking account of trends in generator deactivation and added capacity from the PJM Generator Interconnection Queues.³⁵ More work and analysis needs to be done in this area, as discussed later in these comments, but the analysis to date strongly indicates that market mechanisms *can effectively meet* the challenges posed by a changing resource mix.

Third, the DOE NOPR ignores the PJM competitive markets’ demonstrated strength as a platform for innovation and adaptation. Competitive markets are very good at quickly recognizing and rewarding efficiency gains. That inherent strength is itself an important advantage to maintaining a resource base that leverages technological change to help ensure long-term reliability. Competitive markets, therefore, have seen markedly higher development and implementation (compared to non-market areas) of highly efficient, latest generation combined cycle plants, new storage technologies, and demand response.³⁶ At the same time, competitive markets have not been conducive to high-risk, high-capital-cost, experimental technologies—which, more often than not, have produced

³⁵ *Id.* at 4 n.9.

³⁶ *Resource Investment in Competitive Markets*, PJM Interconnection, L.L.C., (May 5, 2016), <http://www.pjm.com/~media/library/reports-notice/special-reports/20160505-resource-investment-in-competitive-markets-paper.ashx> (“PJM 2016 Resource Investment Whitepaper”).

far more cost than benefit for ratepayers in the regulated areas where such projects have been pursued.³⁷

Indeed, the market is able to handle changes in technologies and shifts in resource mix in a manner that resulted in lower energy market Locational Marginal Prices (“LMPs”) (Figure 2). As can be seen, load-weighted LMPs peaked in 2008. Since that time, the factors discussed above (particularly the reduction in price, and increase in availability, of natural gas) have resulted in a drop of over 50% in load-weighted LMPs. By contrast, the fuel-adjusted LMP (which seeks to factor out differences in fuel cost), has changed relatively little—revealing that the observed drop in load-weighted LMP has indeed been largely driven by fuel cost changes.

Figure 2. Annual Fuel-Adjusted and Load-Weighted LMP (1999-2016)

Furthermore, for roughly two decades the PJM energy market, based on the LMP construct, has provided reliable price signals that, among other things, have helped to drive efficient resource entry and exit.³⁸

³⁷ *Id.*

3. *The DOE NOPR Ignores Efforts Underway to Address Resilience through Markets*

PJM is examining resilience, as distinguishable from reliability, and the DOE NOPR overlooks many of what PJM would consider to be the more salient resilience issues, which relate to the transmission grid and not to supply resources. Moreover, the DOE NOPR suggests a remedy, namely cost of service compensation for resources that satisfy an on-site fuel storage criterion, which would yield few if any system reliability or resilience benefits.

On March 30, 2017, PJM issued a report that examined the reliability implications of PJM's changing resource mix, as driven by environmental regulations, the availability of low-cost natural gas, the increasing penetration of renewable resources and demand response, and the potential retirements of nuclear power plants.³⁹ Among other things, the Evolving Resource Mix and Reliability Report found: (1) as the potential resource mix moves in the direction of less coal and nuclear generation, generator attributes of frequency response, reactive capability, and fuel assurance decrease, but flexibility and ramping attributes increase; and (2) operational reliability can be maintained even if natural gas-fired resources replaced all coal-fired and nuclear generation resources.⁴⁰

Notably, the Evolving Resource Mix and Reliability Report primarily examined *reliability* in the context of the bulk electric system, not *resilience*. Resilience, as PJM and other entities define it, which is the putative focus of the DOE NOPR, relates to preparing for, operating through, and recovering from a high-impact, low-frequency

³⁸ PJM began operating as an independent system operator, using the LMP construct, on January 1, 1998. See *Pennsylvania-New Jersey-Maryland Interconnection, et al.*, 81 FERC ¶ 61,257 (1997); *order on reh'g*, 92 FERC ¶ 61,282 (2000).

³⁹ See Evolving Resource Mix and Reliability Report at 1; see also DOE Staff Report at 99.

⁴⁰ Evolving Resource Mix and Reliability Report at 5.

event. Resilience means remaining reliable even during those events. PJM believes a heavy reliance on one resource type, such as a theoretical resource portfolio composed of 86 percent natural gas-fired resources, *could* raise questions about system resilience.⁴¹ Relying too heavily on a single fuel type could negatively impact resilience because of the potential for reduced diversity of resource attributes.⁴² In general, a more diverse resource portfolio is a more resilient portfolio. PJM's resource portfolio is more diverse today than ever before, and the PJM region is less dependent on any single fuel type than other regions of the country.⁴³

PJM and its stakeholders regularly examine resilience-related low-probability and high-impact events that could cause reliability impacts to the PJM system. For example, PJM recently held a stakeholder event on security and resilience,⁴⁴ including cyber and physical security, and previously held a stakeholder event on fuel diversity and resilience.⁴⁵ Also, PJM has focused particular attention on techniques to identify and mitigate natural gas infrastructure vulnerabilities. On October 10, 2017 the PJM Operating Committee reviewed information on resilience planning related to gas-electric coordination.⁴⁶ To advance resilience, PJM intends to create operating procedures that

⁴⁶ See *Operationalizing Gas Pipeline Contingencies Normal and Conservative Operations*, PJM Interconnection, L.L.C., (Oct. 10, 2017), <http://www.pjm.com/-/media/committees-groups/committees/oc/20171010/20171010-item-16-gas-electric-contingencies-update.ashx>.

will define specific processes to be followed to evaluate the risk on the electric system of natural gas infrastructure vulnerabilities, with a clear understanding of natural gas infrastructure redundancy including generator dual-fuel capabilities such as on-site liquid fuel. Those procedures also will operationalize natural gas pipeline contingencies under normal operations and external threat conditions, such as cyber and physical threats. Given the early stages of this collaboration, the next steps for PJM and its stakeholders include defining metrics for resilience and criteria for evaluating potential mitigating actions not limited to generation as was the focus of the DOE NOPR, but, rather also to include market changes, operational changes such as reserves, transmission upgrades and evolving distributed energy resource technologies and resources. PJM is also highly engaged with stakeholders in incorporating resilience as a driver or a factor in the transmission planning process with the objective of minimizing or eliminating in some cases the criticality of facilities.

4. *The DOE NOPR Provides No Basis for Singling Out RTO Markets, Much Less RTOs with Capacity Markets*

The DOE NOPR bemoans the spate of “premature” retirements of coal and nuclear generation resources as causing a resilience crisis that demands federal government intervention in the form of cost of service subsidies. According to the DOE NOPR, this phenomenon appears to occur only in competitive RTO-administered markets, which purportedly favor cheaper, but less fuel-secure, natural gas to the detriment of coal and nuclear. The DOE NOPR ties the increased reliance on natural gas (and corresponding decreased reliance on coal and nuclear) to an asserted reduction in resilience that can be fixed by only reverting these markets from competitive back to cost of service rate recovery – but only for such purported fuel-secure generators.

The narrowed scope of the DOE NOPR (from when it was originally issued to its publication in the Federal Register)⁴⁷ essentially expresses the opinion that States that have elected to rely on RTO markets to assure resource adequacy exclusively through revenues offered in their energy and capacity markets have made the wrong choice. The Federal Power Act creates a collaborative, federal-state scheme of regulation of the electricity industry, and expressly reserves to the states control over in-state “facilities used for the generation of electric energy,”⁴⁸ which includes determining the “[n]eed for new power facilities, their economic feasibility, and [retail] rates and services.”⁴⁹ By rejecting cost of service regulation in favor of markets – a decision in many cases made at the insistence of the predecessor companies that today are demonstrating a kind of buyer’s remorse – states have exercised their authority under the FPA’s jurisdictional split. The DOE NOPR implies that these States have made dangerous decisions that have brought on a resilience crisis caused by markets forcing a “premature” retirement of “fuel-secure” resources. The radical response suggested by the DOE NOPR is not merely encouragement or some form of directive that affected states reverse course and “re-regulate” generation under cost of service principles. Instead, the DOE NOPR calls for federal ratemaking that would pre-empt state preferences, frustrate state legislative

⁴⁷ *Compare Grid Resiliency Pricing Rule, Notice of Proposed Rulemaking*, Department of Energy, (Sept. 28, 2017), https://energy.gov/sites/prod/files/2017/09/f37/Notice_of_Proposed_Rule_making.pdf (“The requirements of this rule shall apply to Commission-approved independent system operators or regional transmission organizations with a day-ahead and a real-time market or the functional equivalent.”), with DOE NOPR at 46,948 (“The requirements of this rule shall apply to Commission-approved independent system operators or regional transmission organizations with *energy and capacity markets and a tariff that contains a day-ahead and a real-time market or the functional equivalent.*”).

⁴⁸ 16 U.S.C. § 824(b)(1); see *Hughes v. Talen Energy Mktg., LLC*, 136 S. Ct. 1288, 1292 (2016).

⁴⁹ *Pacific Gas & Elec. Co. v. State Energy Resources Conservation and Development Comm’n*, 461 U. S. 190, 205 (1983).

actions and impose (contrary both to the Federal Power Act and to longstanding judicially clarified divisions of federal and state responsibilities as relates to resource adequacy) a Washington-based federal solution in lieu of actions individual states might take to meet resilience objectives. Accordingly, the DOE NOPR's singular focus on regions with capacity markets (and possibly on PJM in particular) is arbitrary and unsupported, which calls into question whether the claimed focus of the rule—i.e., resilience—is not a pretext for other objectives, such as supporting certain politically-favored resources.

The DOE NOPR provides no explanation why RTO's with capacity markets in general or PJM's capacity market specifically are to blame for the so-called resilience crisis. In fact, evidence from the DOE's own data demonstrates that RTOs are no more affected than any other region, by resource retirements and changes in the resource mix. First, RTO regions do not rely more heavily on natural gas for winter capacity⁵⁰ than non-RTO regions, as demonstrated by Energy Information Administration data for winter 2015.⁵¹ Indeed, as shown by Figure 3, PJM's winter capacity mix showed nearly the

⁵⁰ PJM chose to review winter data because the DOE NOPR suggests that the resilience crisis is heightened in the winter due to a heavy reliance on natural gas both for power generation and heating fuel. *E.g.*, DOE NOPR at 46,942 (“Using these retiring units enabled utilities to meet customer demand during a period when already limited natural gas resources were diverted from electricity production to meet residential soheating needs. Once retired, however, these units will not be available for the next unseasonably cold winter.”).

⁵¹ The Energy Information Administration's 2015 Form EIA-860 Data - Schedule 3, 'Generator Data' (Operable Units Only), at columns: *Technology*; *Winter Capacity (MW)*; and Data - Schedule 2, 'Plant Data'; *Winter Capacity (MW)*; at columns: *Balancing Authority*; <https://www.eia.gov/electricity/data/eia860/>, (both retrieved Oct. 16, 2017), were the primary source for bar charts in Figure 3, supplemented with data from “NERC Balancing Authorities and Reliability Coordinators,” North American Electric Reliability Corporation; http://www.nerc.com/comm/OC/RS%20Landing%20Page%20DL/Related%20Files/BA_Bubble_Map_20160427.pdf; <http://www.nerc.com/pa/rrm/TLR/Pages/Reliability-Coordinators.aspx>; (Retrieved Oct. 16, 2017); and “Report on the Capacity, Demand and Reserves (CDR) in the ERCOT Region, 2017-2026,” The Electric Reliability Council of Texas; at p. 32; Dec. 15, 2016;

lowest winter reliance on natural gas and a significantly greater contribution of combined coal and nuclear resources to fulfill winter needs than almost all other NERC regions in the continental U.S.

Figure 3. 2015 Winter Capacity Mix: Natural Gas v. Coal & Nuclear Combined

As the 2015 winter capacity data demonstrate, among the regions most reliant on natural gas were ERCOT, Florida, and the Southern Company areas—all of which operate outside of Commission-approved RTOs and without RTO-administered capacity markets. PJM’s reliance on gas-fired generation is among the lowest of the regions studied. Likewise, PJM’s proportion of coal and nuclear in its winter fuel mix is higher

<http://www.ercot.com/content/wcm/lists/96607/CapacityDemandandReserveReport-Dec2016.pdf>
(Retrieved Oct. 16, 2017).

than any region (except for VACAR, which has had about the same percentage reliance on coal and nuclear) further demonstrating that the DOE NOPR's worry about overreliance on natural gas or mass retirements of coal and nuclear are no more applicable in PJM specifically or capacity markets generally, than they are in other areas of the country. Under the DOE NOPR's narrow view that "fuel-secure" resources are needed to ensure reliability and resilience, the PJM region is more fuel diverse and resilient than vast regions without capacity and energy markets, and would remain so even if PJM reduced its reliance on coal and nuclear (to, for example, the level maintained by the Southern Companies region), or increased its reliance on natural gas (to, for example, the level maintained in Florida or ERCOT).

This comparison underscores that the DOE NOPR's criteria and scope are either arbitrary and irrational or motivated by altogether different objectives than those offered as the basis for urgent action. Reliability and resilience are far more complex than the mere maintenance of a preferred class of allegedly fuel-secure resources, and the DOE NOPR offers nothing to show that there is a greater concern with either reliability or resilience in the areas, like PJM, served by capacity and energy markets.

PJM assessed the probability of generator retirements in PJM versus those in "regulated environments" (i.e., areas outside of competitive markets), and found that the "probability of the mathematically average generator retiring in PJM is lower than in the regulated environment."⁵² The analysis concludes that "[a] statistical examination of retirement data in PJM compared to regulated environments refutes any assertion that

⁵² PJM 2016 Resource Investment Whitepaper at 32.

PJM markets are prematurely retiring economically viable generation.”⁵³ Regarding the changing resource mix, PJM has explained,

[t]he electricity resource mix has shifted throughout PJM’s history, and the PJM system has proven reliable in the face of change. Adequacy and security are two key aspects of reliability. The PJM planning process and capacity market maintain resource adequacy by ensuring sufficient resources to meet demand under extreme conditions.⁵⁴

Indeed, the performance of the PJM system in response to incredibly taxing events like the 2014 Polar Vortex demonstrate the reliability and resilience of the system created by effective transmission planning and development and the energy and capacity markets. The DOE NOPR’s singular focus on capacity markets, therefore, is unjustified.

PJM and other markets also are adaptable to changes that impact reliability or resilience. The Polar Vortex presents a compelling example. Despite serving customers reliably throughout the Polar Vortex, in response to the level of forced generation outages and performance failures, PJM and other regions set about to study the underlying causes and provide solutions. PJM determined that primary operational challenges presented by events such as the Polar Vortex could be mitigated if generation suppliers made investments in weatherization or increased operations budgets.⁵⁵ PJM’s “Capacity Performance” reforms adopted market solutions to the generation challenges wrought by events like the Polar Vortex by: (1) incentivizing better performance by paying generators for performance and allowing recovery of investments to enhance operational

⁵³ *Id.* at ii.

⁵⁴ Evolving Resource Mix and Reliability Report at 8.

⁵⁵ Reforms to the Reliability Pricing Market (“RPM”) and Related Rules in the PJM Open Access Transmission Tariff (“Tariff”) and Reliability Assurance Agreement Among Load Serving Entities (“RAA”) of PJM Interconnection, L.L.C., Docket No. ER15-623-000, at 19 (Dec. 12, 2012).

reliability (e.g., firming fuel supply, investing in dual-fuel capability, increased staffing, capital investments for better operational flexibility, and cold-weather testing on alternate fuels); and (2) discouraging poor performance by imposing a strong monetary penalty (with limited exceptions).⁵⁶ Other regions affected by the Polar Vortex undertook similar market-oriented reforms in response.⁵⁷ The DOE NOPR fails to mention or consider the import of these reforms and the ability of the organized markets to address emerging needs effectively through market-based mechanisms in line with the Commission's long-standing policy of promoting competition, as opposed to the regression to cost of service ratemaking proposed in the DOE NOPR.

Moreover, the DOE NOPR flatly ignores the many tools and benefits that RTOs and their markets provide to promote resilience and reliability in the face of extreme events. RTOs possess dispatch control over extensive resources within their regions, cohesively manage transmission system reliability over large regions to ensure the delivery of those resources, provide reliability coordination and other services over a vast transmission system, optimize operating and other reserves over a wider area, and develop mechanisms such as day-ahead energy and capacity markets to ensure sufficient capacity prior to real-time. The shortsightedness of the DOE NOPR in failing to recognize these benefits suggests that reliability and resilience may not be the underlying goals of the DOE NOPR's proposal.

⁵⁶ See *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208, at P 9 (2015), *order on reh'g*, 155 FERC ¶ 61,157, at P 26 (2016), *aff'd sub nom. Advanced Energy Mgmt. All. v. FERC*, No. 16-1023 (D.C. Cir. Jan. 19, 2016).

⁵⁷ See *ISO New England, Inc.*, 149 FERC ¶ 61,009, at P 17 (2014).

PJM's experience and analysis demonstrates that the DOE NOPR's focus on competitive capacity markets as the root of any perceived resilience problem is misplaced. The DOE NOPR provides no justification for undermining competitive markets in regions that have adopted robust capacity markets, while assuming that there is no similar problem outside of such markets.

B. The DOE NOPR Fundamentally Undermines Competitive Markets.

The DOE NOPR is a direct assault on competitive markets that the Commission and RTOs have spent years building and refining. By subsidizing one category of resources with full cost of service rate recovery, the DOE NOPR provides an anticompetitive advantage that will lead to uneconomic outcomes in the market. The Commission should decline to adopt the DOE NOPR as contrary to Commission and Congressional policy, and not reverse course on decades of promoting greater competition in the energy industry.

As the Commission is aware, RTO markets like PJM's are single-clearing price auctions in which the RTO clears the total amount of generation needed to serve load reliably at the clearing price that is expected to represent the marginal cost of supply. The Commission has endorsed the concept of single-clearing price markets as being superior to cost of service ratemaking:

Such competitive market mechanisms provide important economic advantages to electricity customers in comparison with cost of service regulation. For example, a competitive market with a single, market-clearing price creates incentives for sellers to minimize their costs, because cost-reductions increase a seller's profits. And when many sellers work to minimize their costs, competition among them keeps prices as low as possible. While an efficient seller may, at times, receive revenues that are above its average total costs, the revenues to an inefficient seller may be below its average total costs and it may be driven out of business. This market result benefits customers, because over time it results in an

industry with more efficient sellers and lower prices. By contrast, sellers have far weaker incentives to minimize costs under cost-of-service, because regulation forces a seller to reduce its prices when the seller reduces its cost.⁵⁸

Subsidizing certain categories of generators to prevent them from retiring fundamentally undermines the competitive market structure and displaces least cost, more efficient resources that would otherwise clear the market. Guaranteeing full cost of service recovery to certain resources permits those often higher-cost resources to offer into the market at artificially-low prices in order to guarantee that they will clear the market, knowing that they will be made whole by the subsidy. The effect is to crowd out lower cost, most efficient resources from clearing the market. Subsidies also drive down clearing prices, which provides a disincentive to invest in newer generation and new technologies, leaving in place aging, less efficient generation resources, while at the same time encouraging early retirement of lower cost, more efficient generators that cannot compete on price with subsidized generators. In short, providing full cost of service rate recovery to favored resources severely distorts market prices and investment signals, significantly degrading competitive markets, and leaves in place uneconomic, aging assets that would be forced into retirement but for the subsidy.

C. The DOE NOPR's Many Legal Infirmities Preclude Its Adoption.

The DOE's NOPR offers no defensible legal rationale for its proposal. In fact, the proposal simply cannot be reconciled with the Federal Power Act or with the policies Congress has embedded in the statute.

1. The DOE NOPR Contradicts Congressionally Endorsed Reliance On Competitive Wholesale Electricity Markets.

⁵⁸ *PJM Interconnection, L.L.C.*, 117 FERC ¶ 61,331, at P 141 (2006).

Commencing with its Order No. 888,⁵⁹ the Commission has required open access transmission and has encouraged the ongoing development of wholesale power markets, including the organized, regional markets administered by ISOs and RTOs. The overriding purpose of these efforts has been pursuit of Congress's "goals of creating more competitive bulk power markets and lower rates for consumers."⁶⁰ Indeed, the Energy Policy Act of 2005, in the Commission's view, embodies a national policy "to foster competition in wholesale electric power markets"⁶¹ and "affirmed a commitment to competition in wholesale natural gas and electricity markets as national policy."⁶²

The DOE NOPR openly and irreconcilably conflicts with this national policy objective. The DOE's proposal is targeted specifically at Commission-approved RTOs and ISOs with capacity and energy markets.⁶³ If adopted, the proposed rule would

Preambles ¶ 31,036 (1996), *order on reh'g*, Order No. 888-A, 1996–2000 FERC Stats. & Regs., Regs. Preambles ¶ 31,048, *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *reh'g denied*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in part & remanded in part sub nom. Transmission Access Policy Study Group v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom. New York v. FERC*, 535 U.S. 1 (2002).

⁶⁰ Order No. 888 at 31,673; *see also id.* at 31,644 (stating a "goal of the Energy Policy Act [of 1992] was to promote greater competition in bulk power markets"); 31,683 (stating no-action alternative would be "counter to the direction from the Congress in the Energy Policy Act and the needs of the marketplace and electricity consumers").

⁶¹ *Wholesale Competition in Regions with Organized Electric Markets*, Order No. 719, 2008–2013 FERC Stats. & Regs., Regs. Preambles ¶ 31,281 at P 1 (2008), *as amended*, 126 FERC ¶ 61,261, *order on reh'g*, Order No. 719-A, 2008–2013 FERC Stats. & Regs., Regs. Preambles ¶ 31,292, *reh'g denied*, Order No. 719-B, 129 FERC ¶ 61,252 (2009). *See also* Order No. 719-A at P 122 (in the Energy Policy Act of 2005, Congress ratified the "Commission's policy . . . to promote competition in wholesale electric power markets").

⁶² *Transparency Provisions of Section 23 of the Natural Gas Act*, Notice of Proposed Rulemaking, FERC Stats. & Regs. ¶ 32,614, at P 11 (2007).

⁶³ DOE NOPR, 82 Fed. Reg. at 46,948 (proposed amended version of 18 C.F.R. § 35.28(g)(10)(ii)). The DOE's proposed regulatory language is not entirely clear. The quoted provision would state that "[t]he

require each affected ISO/RTO to create and collect cost of service rates for each “eligible resource” under the new rule. Coal-fired and nuclear generators comprise just over fifty percent of all currently installed generation capacity in the PJM region,⁶⁴ meaning that the DOE NOPR proposal, if adopted would remove half of all the capacity in the PJM region from the discipline of competitive market forces. This outcome is clearly incompatible with “the Congressional mandate in the Energy Policy Act of 1992 to encourage competition in electricity markets.”⁶⁵ The DOE NOPR nevertheless does not even attempt to reconcile its proposed regulatory retrenchment with clear Congressional and Commission policy preference for competitive markets as reflected in the Energy Policy Acts of 1992 and 2005. This reason alone justifies rejection of the DOE’s proposal.

requirements of this rule shall apply” only to the indicated subset of ISOs/RTOs. However, the ensuing proposed subsection would state that “[e]ach Commission-approved [ISO and RTO] shall establish a tariff” that incorporates the rule’s proposed cost-plus pricing guaranty for “eligible grid reliability and resiliency resources” as the proposed rule defines them. *Id.* (proposed amended version of 18 C.F.R. § 35.28(g)(10)(iii)). For present purposes, PJM interprets “this rule” in proposed subparagraph (g)(10)(ii) to refer to the proposed regulatory language as a whole, and thus to mean that the DOE intends the new rule to apply only in the subset of regions meeting that subparagraph’s criteria. Should PJM be mistaken about the true scope of the proposal, it reserves its right to assert any objections that it may have to the proposal in its full, intended scope, regardless of whether such objections may be additional to or different from those articulated in these comments.

⁶⁴ See *supra* note 4.

⁶⁵ Order No. 888-A at 30,183.

2. *The DOE's Proposal To Guarantee Eligible Resources' Recovery Of All Costs Plus A Return Is Contrary To Law.*

The United States Supreme Court has stated that “regulation does not assure that the regulated business make a profit.”⁶⁶ The Court later added that “[t]he due process clause . . . has not and cannot be applied to insure values or to restore values that have been lost by the operation of economic forces.”⁶⁷ The DOE NOPR, in contrast, would require “pricing to *ensure* that each eligible resource . . . *recovers its fully allocated costs and a fair return on equity*,”⁶⁸ even though the DOE Staff Report acknowledges that displacement of coal-fired and nuclear generation is due in large measure to the persistently low price of natural gas—i.e., the very “economic forces” from which regulation under the FPA does not protect regulated public utilities.⁶⁹ Moreover, the DOE NOPR's generic mandate of cost recovery improperly ignores the well-established rights of states and wholesale customers to challenge the prudence of particular utility costs.

As written, therefore, the DOE NOPR would require the Commission to direct the targeted ISOs/RTOs to provide eligible resources with exactly the kind of assurances of

⁶⁶ *Mkt. St. Ry. Co. v. R.R. Comm'n*, 324 U.S. 548, 566 (1945) (citing *FPC v. Hope Nat. Gas Co.*, 320 U.S. 591, 603 (1944) (“*Hope*”)). *Accord FPC v. Nat. Gas Pipeline Co.*, 315 U.S. 575, 590 (1942) (“[R]egulation does not insure that the business shall produce net revenues . . .”).

⁶⁷ *Mkt. St. Ry. Co.* at 567.

⁶⁸ DOE NOPR at 46,948 (proposed revised text of 18 C.F.R. § 35.28(g)(10)(iii)(B)) (emphasis added). Eliminating all doubt that this language would guaranty cost recovery plus a profit for each eligible resource, the proposal goes on to clarify that “[c]ompensable costs shall include, *but not be limited to*, operating and fuel expenses, costs of capital and debt, and a fair return on equity and investment.” *Id.* (proposed revised text of 18 C.F.R. § 35.28(g)(10)(iv)) (emphasis added).

⁶⁹ *Mkt. St. Ry. Co.* at 567; *see also Associated Gas Distribs. v. FERC*, 824 F.2d 981, 1001 (D.C. Cir. 1987) (“*AGD*”) (observing the Supreme Court’s rulings that “the due process clause affords no protection from losses inflicted by market conditions” (citing *Hope*, 320 U.S. 591; *Mkt. St. Ry. Co.*, 324 U.S. 548)).

profit and protection from market forces to which the Supreme Court long ago held regulated entities are not entitled. Accordingly, the Commission cannot lawfully adopt the DOE's proposal.

3. *The DOE NOPR Proposes An Unlawful, Arbitrary and Undue Preference For Eligible Resources.*

Like the companion Natural Gas Act, the Federal Power Act “fairly bristles with concern for undue discrimination.”⁷⁰ While not all discrimination is prohibited,⁷¹ discrimination must be “undue” which occurs “when the classes are not similarly situated.”⁷² Courts will accept disparate treatment “if FERC offers a valid reason for the disparity.”⁷³

The DOE NOPR is *unduly* discriminatory and, therefore, unlawful in at least two critical respects. First, it offers no sound basis for the preferential pricing it proposes for eligible resources. Second, it explains no rationale for creating a new pricing regime for eligible resources to apply only in ISO/RTO regions that have capacity and energy markets, while leaving unchanged the jurisdictional rates of all generators (including

⁷⁰ *AGD*, 981 F.2d at 998.

⁷¹ *BP Energy Co. v. FERC*, 828 F.3d 959, 967 (D.C. Cir. 2016) (“No undue discrimination exists where there is ‘a rational basis for treating [two entities] differently’ and such differential treatment is ‘based on relevant, significant facts which are explained.’”(alteration in original) (quoting “*Complex*” *Consol. Edison Co. of N.Y., Inc. v. FERC*, 165 F.3d 992, 1012-13 (D.C. Cir. 1999))).

⁷² *PJM Interconnection, L.L.C.*, 137 FERC ¶ 61,145, at P 109 (2011).

⁷³ *Black Oak Energy, LLC v. FERC*, 725 F.3d 230, 239 (D.C. Cir. 2013) (alteration in original) (internal quotation omitted) (citation omitted). *See also Ark. Elec. Energy Consumers v. FERC*, 290 F.3d 362, 367 (D.C. Cir. 2002) (“A rate is not ‘unduly’ preferential or ‘unreasonably’ discriminatory if the utility can justify the disparate effect.” (quoting *Metro Edison Co. v. FERC*, 595 F.2d 851, 857 (D.C. Cir. 1979))); *Elec. Consumers Res. Council v. FERC*, 747 F.2d 1511, 1515 (D.C. Cir. 1984) (same).

those that otherwise might qualify as eligible resources if located in a targeted ISO/RTO footprint) in all other regions of the nation.

The courts have recognized that it may be reasonable for the Commission to draw distinctions between types or classes of resources for some purposes. PJM's minimum offer price rule⁷⁴ and Capacity Performance⁷⁵ reforms provide two such examples, which underscore the DOE NOPR's critical omission: Unlike the DOE NOPR, in adopting the PJM rules, the Commission provided a sound rationale, supported by substantial evidence, for distinguishing between certain types of resources.

Critically, in support of its proposal, the DOE cites not a single incident or event when the on-site availability of 90 days' fuel supply was or would have been the difference in maintaining reliable electric service in any of the targeted ISO/RTO regions (or anywhere else). Indeed, the DOE NOPR fails to connect its proposed 90-day on-site fuel supply criterion with prevention or mitigation of any outage or other reliability issue in any targeted market at any time. Likewise, the DOE fails to articulate why the problem only exists in RTOs and ISOs with capacity markets.⁷⁶

⁷⁴ The Commission approved applying PJM's minimum offer price rule to natural gas-fueled generators, but not to intermittent renewable resources like wind and solar generation. *See supra* note 72, *PJM Interconnection, L.L.C.*, 113 FERC ¶ 61,145 at PP 109-111, *aff'd sub nom. N.J. Bd. of Pub. Utils. v. FERC*, 744 F.3d 74 (3d Cir. 2014).

⁷⁵ The Commission and the courts accepted PJM's "Capacity Performance" reforms, which limited participation in the PJM capacity market to resources that are capable of providing energy or reducing demand on a year-round basis. *See supra* note 56.

⁷⁶ *See supra* Section II.A.4.

Because the DOE NOPR fails to articulate any rational connection between the facts it marshals, the problem it identifies, and the solution it seeks to inflict, the Commission cannot lawfully adopt it.⁷⁷

4. The Commission's Comment Deadlines Do Not Provide The Meaningful Opportunity To Comment Required By The Administrative Procedure Act.

Section 553(c) of the Administrative Procedure Act requires an agency, after publishing notice of a proposed rule, to “give interested persons an opportunity to participate in the rule making through submission of written data, views, or arguments.”⁷⁸ The purposes of these procedural requirements are to “assure[] fairness and mature consideration of rules having a substantial impact on those regulated,”⁷⁹ and to “educate[] the agency, thereby helping to ensure informed agency decisionmaking.”⁸⁰ These objectives dictate that an agency must provide a “meaningful opportunity” to comment.⁸¹ Therefore, according to the drafters of the Act, matters “of great importance, or those

⁷⁷ *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (stating that an agency must articulate “a ‘rational’ connection between the facts found and the choice made” (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962))).

⁷⁸ 5 U.S.C. § 553(c).

⁷⁹ *Pennzoil Co. v. FERC*, 645 F.2d 360, 371 (5th Cir. 1971).

⁸⁰ *Chocolate Mfrs. Ass'n v. Block*, 755 F.2d 1098, 1103 (4th Cir. 1985); *see also Nat'l Tour Brokers Ass'n v. United States*, 591 F.2d 896, 902 (D.C. Cir. 1978) (explaining that the purpose of the notice-and-comment procedure is “to allow the agency to benefit from the experience and input of the parties who file comments . . . and . . . to see to it that the agency maintains a flexible and open-minded attitude towards its own rules.”); *N.C. Growers' Ass'n, Inc. v. United Farm Workers*, 702 F.3d 755, 763 (4th Cir. 2012) (“The important purposes of this notice and comment procedure cannot be overstated. The agency benefits from the experience and input of comments by the public, which help ‘ensure informed agency decisionmaking.’” (quoting *Spartan Radiocasting Co. v. FCC*, 619 F.2d 314, 321 (4th Cir. 1980))).

⁸¹ *Prometheus Radio Project v. FCC*, 652 F.3d 431, 450 (3^d Cir. 2011) (quoting *Rural Cellular Ass'n v. FCC*, 588 F.3d 1095, 1101 (D.C. Cir. 2009)).

where the public submission of facts will be either useful to the agency or a protection to the public, should naturally be accorded more elaborate public procedures.”⁸²

The DOE proposes nothing less than for the Commission to reverse two decades of resolute reliance on market forces to ensure just and reasonable wholesale prices for electricity—a bedrock policy which, as the Commission has observed on a variety of occasions, Congress first encouraged and later ratified. The Commission’s own staff has published an extensive (though certainly not billed as exhaustive) list of questions and issues that the DOE NOPR presents, but does not address.⁸³ Nevertheless, interested parties were given a mere 13 days to comment after the DOE NOPR was published in the Federal Register.

The courts strictly enforce the APA’s procedural steps, and a comment period of “exceedingly short duration” will support a finding that an agency has failed to offer the public a meaningful opportunity to comment on a proposed rule.⁸⁴ The “instances actually warranting” a comment period as brief as the Commission is permitting here “will be rare,” and “are generally characterized by the presence of exigent circumstances in which agency action [is] required in a mere matter of days.”⁸⁵ When considered in the light of the import, scope, and potential costs to consumers of the DOE’s proposal, the DOE NOPR fails utterly to justify the extremely expedited schedule the Commission has

⁸² Administrative Procedure Act: Legislative History, S. Doc. No. 79-248, at 259 (2d Sess. 1946); Charles H. Koch Jr., 1 Administrative Law and Practice 329-30 (2010 ed.).

established, resulting in a procedural schedule that plainly falls short of the APA's minimum requirements.

III. ALTHOUGH THE LACK OF BASIS FOR THE DOE NOPR AND THE ILLEGAL REFORMS IT PROPOSES SUPPORT NOT IMPLEMENTING THE PROPOSAL, PJM BELIEVES THE AUGUST DOE REPORT APPROPRIATELY HIGHLIGHTED A PROBLEM PJM IS FACING WITH PRICE FORMATION THAT SHOULD BE ADDRESSED THROUGH REFORMS TO BE SUBMITTED TO THE COMMISSION WITHIN A COMMISSION-DIRECTED TIME FRAME

A. The Need for Targeted Consideration of This Change in the PJM Region

PJM notes at the outset that the DOE NOPR itself has directed its reforms solely to regions with energy and capacity markets. Further, given its focus on coal and nuclear units, it is clear that the region to which the DOE most directs its remedy is the PJM Region since the PJM Region has an abundance of coal and nuclear units still in service.⁸⁶ Thus, the DOE has already 'carved out' the PJM region for special recognition by the Commission. Although PJM disputes the rationale supporting the DOE's NOPR, the DOE's recognition of the need for targeted action in PJM is one with which PJM concurs.

1. PJM has Observed and Adapted to Significant Market Changes in Recent Years.

PJM's markets are resource agnostic, and have evolved over the years to include a variety of resource types including coal, natural gas steam, natural gas combustion turbine, oil steam, oil combustion turbine, nuclear, solar, wind, hydroelectric, battery/storage, and demand response. In recent years, the industry has experienced a significant fuel and technology shift to natural gas and renewable resources, prompted by

⁸⁶ See *supra* Figure 3.

low-cost shale gas, the efficiency improvements of combined-cycle gas turbines, and the improving economics of renewable energy driven in part by government incentives. Between 2010 and 2016, coal resources comprised 79 percent of the capacity retired in PJM,⁸⁷ and natural gas and renewable resources comprised 87 percent of the new capacity in PJM.⁸⁸ By 2016, PJM's installed capacity consisted of 33 percent coal, 33 percent natural gas, 18 percent nuclear, and 6 percent renewables (including hydro).⁸⁹

PJM points out the following signs that the current environment is an opportune time to examine whether prices in the PJM energy market are formed as efficiently as possible. First, the competitive economics of combined-cycle gas turbines, assisted by low-cost shale gas and increasing renewables with zero fuel costs, has led to steadily flattening supply curves (Figure 4). The impact of this trend is particularly strong from 120,000 megawatts to 150,000 megawatts of load, the range in which peak load levels typically occur in the summer and winter. As Figure 4 shows, in 2015 and 2016 the supply curve remained relatively flat throughout this range, never reaching the point at which supply prices begin to increase significantly.

⁸⁷ See *Generation Activation Summary Sheets*, PJM Interconnection, L.L.C., <http://www.pjm.com/planning/generation-deactivation/gd-summaries.aspx> (last visited Oct. 23, 2017).

⁸⁸ See *PJM Generation Queues: Active (ISA, WMPA, etc.)*, PJM Interconnection, L.L.C. (Oct. 22, 2017, 11:35 a.m.), <http://www.pjm.com/planning/generation-interconnection/generation-queue-active.aspx>. Queue project megawatts are based on "MW placed in service" with Status Codes of IS, UC-ISP, or Active-ISP, and represent the new generation capability added to the system. Actual capacity interconnection rights may be lower based on limitations for certain fuel types or rights as specified in individual interconnection agreements.

⁸⁹ See PJM Interconnection, L.L.C., <http://www.pjm.com/~media/markets-ops/ops-analysis/capacity-by-fuel-type-2016.ashx> (last visited Oct. 23, 2017).

Figure 4. Average Supply Curves (2010, 2011, 2015, and 2016)

Also, as energy market revenues in PJM have declined, capacity market revenues have played a more significant role in generators' total revenues. (Figure 5).⁹⁰

Figure 5. Revenue Segments

⁹⁰ Revenues from the energy and capacity markets were 74.3 percent and 22.9 percent, respectively, of the total generation revenue in 2015, and 71.1 percent and 26.6 percent, respectively, in 2016. The total payments for ancillary services represent 2.8 percent of the total generation revenue in 2015 and 2.3 percent in 2016.

To the extent that these phenomena are strictly the result of supply and demand fundamentals, there would be no problem to be resolved. However, upon observance of these trends, PJM has endeavored to research whether energy market prices are accurately reflecting the value of the resources being utilized to maintain system reliability, both from the standpoint of meeting system demand as well as providing the flexibility the system operator needs to meet constantly changing conditions. Improved price formation will result in a better, more transparent reflection of the marginal resources on the system as well as create incentives for units to follow dispatch instructions and to make their units more flexible to respond to changing load demands. In general, improved price formation, as discussed more fully below, may help to ensure an appropriate mix of resources that can meet future grid demands and have clear incentives to follow dispatch instructions.

2. *The Problems PJM is Experiencing as a Result of Such Changes can be Addressed through Price Formation Reforms in PJM.*

In the case of the need for price formation reforms, the Commission should note the following characteristics which identify the PJM region as eligible for prompt remedy of the particular price formation problem noted above.

For instance, in light of the reforms to PJM's capacity market in moving to the Capacity Performance construct, reliability pricing has supplemented energy pricing to help attract efficient resource investment to meet the resource adequacy needs. However, beyond the aggregate resource attributes such as maximum economic generation and forced outage rate, the capacity market is not intended to reward flexibility attributes such as short starting time, short minimum running time, low minimum economic generation and fast ramping rate that are essential to efficiently meet operational needs.

As the availability of an appropriate mix of these flexibility attributes is essential for reliable system operation, the value of flexibility should be appropriately reflected in energy and reserve market pricing to incent the attributes needed to maintain system reliability efficiently. Going forward, this is particularly important because of, among other things, the anticipated continuing increase in distributed, intermittent resources and demand response coming on to the PJM system.

PJM believes that price formation reforms in PJM should ensure that efficient commitment and dispatch solutions are supported by efficient prices and settlement with reduced uplift and improved incentives are accomplished in ways that will be more consistent with several other ISOs/RTOs, including its neighbors MISO and NYISO that have adopted energy pricing enhancements previously and will lessen the seams issue.

Another characteristic of PJM which identifies the PJM region as eligible for prompt remedy is that, as PJM noted in its comments in response to the Commission's Fast Start Pricing NOPR,⁹¹ PJM has not yet adopted the level of reforms as other regions with respect to fast-start pricing. Other regions have already experienced the benefit of more flexible pricing methods whereas PJM has yet to make similar enhancements. Additionally, given the demographics of PJM's fleet such as the significant penetration of relatively large combined cycle natural gas units, PJM feels that an expansion is necessary to fully address price formation in PJM. Simply, PJM does not have many

⁹¹ See *Fast-Start Pricing in Markets Operated by Regional Transmission Organizations and Independent System Operators*, Notice of Proposed Rulemaking, at P 54 (2016) ("Fast Start Pricing NOPR").

units that meet the FERC definition of “fast-start” and therefore PJM needs a broader approach that allows for regional differences.⁹²

PJM believes that the confluence of the conditions described above drives the need for a reform to certain aspects of price formation in the PJM region. The goal is to ensure price signals that foster efficient resource-investment decisions and enable participation of demand response (both energy and reserves), variable energy resources, and distributed energy resources. Efficient energy and reserve price formation, under both shortage and non-shortage conditions, would more accurately and transparently value all of the resources on the system that are needed to reliably serve load. Enhancing energy market price formation represents a beneficial and essential first step. PJM has explained its conceptual proposal to address price formation to Dr. William Hogan, Ph.D., described below. In a letter to PJM, Dr. Hogan expressed his concurrence stating:

PJM staff is proposing to reform the existing pricing model in order to ensure that the cost of serving load is reflected in LMP to the fullest extent possible, uplift is reduced and incentives are maintained. This follows the principles of sound market design. Enhanced energy market price signals will strengthen performance incentives in PJM’s markets and is complementary to other reforms being considered by PJM. Given my knowledge of the PJM resource profile, this reform would be an appropriate step forward in price formation for the PJM region.⁹³

While enhancements to the LMP calculation in these other ISOs/RTOs have focused on fast-start resources, PJM believes it needs to enhance price formation as it

⁹² PJM Interconnection, L.L.C. Comments to Notice of Proposed Rulemaking, Docket No. RM17-3-000, at 4 (Feb. 28, 2017).

⁹³ Letter to Mr. Stu Bresler, Sr. Vice President Operations & Markets, PJM Interconnection, L.L.C. from William W. Hogan, RE: PJM Price Formation, October 23, 2017, included as Appendix B.

relates to all resource types. PJM's resource mix is different than other regions. In particular, natural gas resources in PJM are not limited to fast-start combustion turbines, but rather are represented by significant quantities of larger, combined cycle units. These resources are competing directly with other resource types, and it therefore does not make sense to limit the price-setting contribution discussed here to only the fast-start class of units, but rather to enhance price formation such that it is neutral to fuel source or resource class such that all units have the opportunity to compete comparably.

Identification of the need for price formation reforms will not create new seams issues between PJM and its neighbors. For one, MISO and PJM already depart from how prices are formed with MISO utilizing its ELMP method. By the same token, New York does currently employ a hybrid-pricing methodology that appropriately allows inflexible resources to set prices in their region when needed. These differences in pricing practices have not inhibited efficient coordination on the seams and have not resulted in any reliability concerns. Further, neither of those regional changes have inhibited the free flow of energy across the various borders PJM has with its neighbors. The RTOs have worked hard to address those seams issues over the years. The mere existence of different pricing regimes is already inherent in the Commission's deference to regional solutions. To now use this as a sword to thwart an individual region's initiatives will drive the nation to a 'lowest common denominator' solution which serves no region well in the long run.

B. PJM is Setting Forth a Framework for Price Formation Reforms Needed in the PJM Region in the Near Term.

PJM describes herein price formation reforms it is considering to address the problems identified above in the near term. The framework below explains the issue in terms of convexity and non-convexity, in recognition of a technical condition that is essential to addressing the concerns raised with inflexibility. In basic terms, PJM finds itself increasingly in a state of non-convexity which in turn requires payments be made to resources outside of LMP through make whole payments which in turn has led to increased uplift, reducing incentives for flexibility. PJM proposes a way in which such uplift can be minimized.

1. Marginal Cost Pricing and the Convex Condition

Fundamentally, energy price formation is built on the foundation of marginal cost pricing. Marginal cost pricing means that the price is set equal to the incremental cost to produce the last unit of output or, equivalently, the potential increase in system cost if the last-cleared competitive unit were unavailable to serve the demand. In principle, marginal cost pricing enables full cost recovery in competitive markets under the “convex condition.” The convex condition means that the incremental cost of production rises when a generating unit’s output increases, and declines when a generating unit’s output decreases. Under the convex condition, the last-cleared unit is always the highest-ranking unit in the merit order with the highest cost. The optimal strategy under the convex condition is for each generating unit to bid its true costs and physical characteristics.

An inflexible generating unit with a minimum operational limit fails the convex condition because when the output decreases below the minimum operational limit, the cost rises, making it uneconomical to run the unit in that range.⁹⁴ Under non-convex conditions, producers may incur losses if the price is set at marginal cost. Fundamentally, in the presence of non-convexity, there are no market prices that can support competitive market solutions without requiring additional payments through, for example, make whole payments and resulting uplift mechanisms. In wholesale electricity markets with LMP, two different LMP pricing methods have been used to support competitive market solutions under the condition of non-convexity: the restricted LMP method and the extended LMP method.

a. Current LMP Method

The current LMP method was chosen for the initial implementation of the PJM energy market primarily because of its simplicity. The current LMP method ignores the presence of non-convexity in its price-setting logic and assumes that certain units, or certain output ranges of units, are ineligible to set price when they fail the convex condition. It employs a single security-constrained economic dispatch (“SCED”) model for both dispatch and pricing purposes. In the SCED model, only flexible units are eligible to set price, and the costs for inflexible units are excluded in the pricing run, calculating the marginal system costs and determining the market clearing prices.⁹⁵

⁹⁴ In electricity markets, non-convexity also arises for other technical reasons, such as fixed start-up/no-load costs, economies of scale and inflexibilities such as minimum-generation or block-loading requirements.

⁹⁵ FERC recently sought to address the ability of inflexible fast-start units in the Fast-Start Pricing NOPR. FERC’s proposal would require the dispatch and pricing of the system to be done separately so that inflexible fast-start units could be made flexible in order to set prices. FERC’s proposal also sought to include startup and no load for these resources in pricing.

As a result, there have always been circumstances where prices could fail to reflect all elements relevant to sending the right market signals. Specifically, when certain inflexible units are required to serve load but ineligible to set price, and the current LMP method inappropriately lowers energy prices, an uplift payment to the inflexible units is required in order to ensure that their costs are fully recovered. These uplift payments are detrimental to the overall operation of the market because market participants that must pay these costs are unable to predict or hedge against them.

Significant effort has been invested in minimizing these uplift costs over time, including putting limitations on the physical parameters that generating units may submit as part of their offers into the market. However, efficient dispatch processes can only minimize the resulting uplift so much. PJM has been required to create rules to limit physical parameters over the years due to the incentives created by the uplift payments. Currently, resource operators have the incentive to make units as inflexible as possible while still being committed by PJM in order to maximize the uplift payments they can collect.

b. Extended LMP Method

PJM is actively exploring a transition to the extended LMP method.⁹⁶ In the extended LMP method, the conditions that cause non-convexities are relaxed in a pricing run executed separately from the dispatch run in a procedure known as convex relaxation. A dispatched inflexible unit needed to serve load would be treated like a flexible unit and be allowed to set price. Prices that reflect the incremental costs of the most expensive

⁹⁶ For a description of the extended LMP method, see Gribik, P. R., W. W. Hogan, and S. L. Pope, *Market-Clearing Electricity Prices and Energy Uplift*, John F. Kennedy School of Government, Harvard University (2007).

units needed to serve load benefit supply resources with lower costs, making offers from flexible or inflexible units competitive. As a beneficial result, the extended LMP method effectively rewards flexibility, reducing reliance on the uplift payments with improved price signals that incent resource performance in market operations. These incentives will be necessary in the future, as the PJM system continues to experience further penetration of intermittent resources.

A defining characteristic of the extended LMP method is that it bifurcates the SCED model into two separate runs: the dispatch run and the pricing run.⁹⁷ This bifurcation already occurs in regions such as MISO, ISONE, and NYISO who all have a sophisticated procedures for fast-start pricing. In the method PJM is investigating, the dispatch run is the same as in the current LMP method and the pricing run is a convex relaxation of the SCED dispatch run. In the pricing run, the inflexible generation units compete with the flexible units and are eligible to set the energy price when they are needed to meet the demand or control transmission constraints. With appropriately designed uplift payments, extended LMP can support efficient commitment and dispatch solutions, because market participants should have no incentive to deviate from the solution and (to a large extent) have no incentive to submit offers that differ from their true costs. The Commission has already shown its comfort with different price setting methods given that both of these price setting methods are in place.⁹⁸

⁹⁷ See *supra* note 96.

⁹⁸ *Midwest Independent Transmission System Operator, Inc.*, 140 FERC ¶ 61,067 (2012).

2. Shortage Pricing

In addition to exploring a more robust method to determine LMPs, PJM also believes that reforms to its shortage pricing rules would benefit price formation and incentivize appropriate behavior that could mitigate operational reliability concerns. Currently, PJM implements shortage pricing if its system is short of 10-minute reserves, which from a reliability perspective would constitute a grave operating condition. Ideally, the market should appropriately incentivize activity to avoid these occurrences. However, once in that condition, market prices should reflect the severity of the condition. Modeling and invoking shortage pricing for longer-term reserve products such as 30-minute reserves would provide better incentives and information to the market regarding potentially severe operating conditions by escalating energy and reserve prices earlier and incentivizing behavior that would ameliorate the condition.

Further, PJM is examining the level and shape of its operating reserve demand curves (“ORDC”). The current ORDCs used in PJM are step functions that are based on PJM’s nominal reserve requirement, which is a function of the largest unit operating on the system. As such, they do not accurately reflect the value of excess reserves on the system in a manner consistent with the reliability value of those reserves. PJM also is investigating the penalty factor levels associated with these curves to ensure they accurately reflect the value that reserves provide to the system under all operating conditions. While PJM recently made incremental changes to its ORDCs, a wholesale review of these curves has not been done since PJM implemented shortage pricing in 2012. To ensure PJM comprehensively addresses all facets of price formation, and

considering potential changes to the LMP methodology and reserve products considered for shortage pricing, now is also an appropriate time to review shortage pricing in PJM.

C. PJM Suggests a Focused Commission Process.

As explained herein, the Commission should act now to ensure that essential reliability services that resources provide are maintained. Reforms are needed in PJM now to ensure that (i) the cost of serving load is reflected in LMP to the fullest extent possible, (ii) uplift is reduced and (iii) proper economic incentives are maintained. Enhanced energy market price signals will strengthen performance incentives in PJM's markets and is in line with other reforms being considered by PJM. PJM understands not all regions face the same need for action. An extensive record has been developed to date in this area in the Commission's price formation proceedings, as confirmed by the August DOE Report. Thus, to move forward, the Commission should direct each RTO/ISO to identify for the Commission whether changes in the resource mix has created issues in their respective regions that are currently not addressed in the market. If any issues exist, the RTO/ISO should prioritize the issues of most consequence to that region and provide, within a Commission-specified deadline that is in the near term, for the submission of proposals, if necessary. In the alternative, the Commission could expand the scope of its existing open price formation NOPRs to provide for regional solutions around the issues it has broadly identified in those dockets.

IV. CONCLUSION

For the foregoing reasons, PJM respectfully requests that the Commission decline to adopt the DOE NOPR (as unsupported) and, in its place, issue an order as discussed herein.

Respectfully submitted,

/s/Jennifer Tribulski

PJM COMMENTS IN RM18-1-000
OCTOBER 23, 2017

APPENDIX A

PJM'S RESPONSES TO SPECIFIC QUESTIONS RAISED BY OEPI IN DOCKET NO. RM18-1-000

I. Need for Reform

Question 1

What is resilience, how is it measured, and how is it different from reliability? What levels of resilience and reliability are appropriate? How are reliability and resilience valued, or not valued, inside RTOs/ISOs? Do RTO/ISO energy and/or capacity markets properly value reliability and resilience? What resources can address reliability and resilience, and in what ways?

PJM Response

For PJM, resilience means the ability to prepare, operate through, and recover from high-impact, low-frequency threats such as extreme weather, electromagnetic pulses, geomagnetic disturbances, earthquakes, cyber and physical attacks, and fuel security limitations.¹ PJM defines the three elements of resilience as:

- Prepare – evaluating and cost-effectively mitigating risks
- Operate – managing through a high-impact disruption
- Recover – regaining essential functions as rapidly as possible

Resilience requires coordinated efforts with operations, transmission and infrastructure planning, business continuity, cyber and physical security, risk management and markets.

PJM is required to plan for and operate transmission system in a manner that meets the mandatory reliability standards under the section 215 of the Federal Power Act, 16 U.S.C. section 824o, as developed and proposed by the North American Electric Reliability Corporation (“NERC”) and accepted by the Commission. These standards address all aspects of reliability including Resource and Demand Balancing, Critical Infrastructure Protection, Communications, Emergency Preparedness and Operations, Facilities Design, Connection, and Maintenance, Interchange Scheduling and Coordination, Interconnection Reliability Operations and Coordination, Modeling, Data, and Analysis, Nuclear, Personnel Performance, Training and Qualifications, Protection and Control, Transmission Operations, Transmission Planning, and Voltage and Reactive. “Reliable operation” is defined under the FPA as:

¹ Industry groups have similar definitions. See, e.g., the North American Transmission Forum in September 2017 paper on transmission system resilience which can be found at the following URL:
<http://www.natf.net/docs/natf/documents/resources/transmission-system-resiliency-an-overview.pdf>

operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.²

The PJM system meets existing standards of reliability.

Resilience addresses challenges and emerging risks *that reliability standards do not address* in order to withstand a prolonged, large-scale outage. Resilience for the bulk-electric system entails:

- Maintaining reliability in the face of significant events
- Incorporating high-impact, low-frequency threats into planning and procedures
- Slowing disruptive events, mitigating their impacts and quickly recovering essential functions
- Protecting essential systems based on assessed risks and hazards
- Improving grid flexibility and control to be able to adapt efficiently and quickly to changed conditions

As discussed in the body of PJM's response³ PJM regularly considers factors that could impact the reliability and resilience of the PJM system. Further, PJM and its stakeholders are continuing to examine resilience-related low-probability and high-impact events that could cause reliability impacts to the PJM system.

Given the changing nature of the fleet and a new set of threats that were not anticipated under the current NERC standards, prudent planning and operations requires the anticipation and mitigation of potential future occurrence of events, such as:

- sustained supply-chain issues
- environmental restrictions that limit operations of an entire fleet of fossil generators
- a nuclear disaster, which causes regulatory reaction for new and existing nuclear fleet
- a single incident causing major, multiple pipeline or supply disruptions for the natural gas fleet or oil fleet
- a major impact to a large portion of the transmission infrastructure that forces an outage lasting for days, such as a major natural disaster that impacts large sections of grid including resources and the infrastructure that connects the resources to consumers

² 16 U.S.C. § 824(a)(4) (2010).

³ PJM Comments at sections II.A.2 and 3.

To that end, PJM has created a Resilience Roadmap⁴ to use in exploring opportunities with its stakeholders, through the stakeholder committees, for addressing resilience. This includes review resilience opportunities from the perspective of transmission planning, operations, including gas/electric coordination and fuel security, markets, and cyber and physical security. Detailed discussions of these efforts are held at the Operating Committee, the Markets and Implementation Committee and/or the Planning Committee, as appropriate. And, to further collaboration with a variety of government and industry stakeholders, PJM is increasing its emphasis on cross-sector coordination.

Given the early stages of this collaboration, the next steps for PJM and stakeholders include defining metrics for resilience and criteria for evaluating potential mitigating actions not limited to generation as was the focus of the DOE NOPR, but rather also to include transmission, operations, cyber and physical security, and advanced system restoration.

Question 2

The proposed rule references the events of the 2014 Polar Vortex, citing the event as an example of the need for the proposed reform. Do commenters agree? Were the changes both operationally and to the RTO/ISO markets in response to these events effective in addressing issues identified during the 2014 Polar Vortex?

PJM Response

As described more fully in the body of PJM's comments,⁵ there is no valid basis for the proposed reform, including the 2014 Polar Vortex or any other extreme weather events cited. Indeed, NERC's Polar Vortex Review found:

Extreme cold weather also had a major impact on generator equipment. Of the approximately 19,500 MW of capacity lost due to cold weather conditions, over 17,700 MW was due to frozen equipment. Many outages, including a number of those in the southeastern United States, were the result of temperatures that fell below the plant's design basis for cold weather. At the height of generation outages (January 7 at 0800) the southeastern United States accounted for approximately 9,800 MW of the outages attributed to cold weather.⁶

⁴ The Resilience Roadmap can be found at the following URL: <http://pjm.com/~media/committees-groups/committees/oc/20170606/20170606-item-18-resilience-roadmap.ashx>.

⁵ PJM Comments at sections II.A, B, and C.

⁶ NERC Polar Vortex Review – 2014 at 12. The report can be found at the following URL: http://www.nerc.com/pa/trm/January%202014%20Polar%20Vortex%20Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf.

And, of the generation that was lost due to fuel supply, all generation resource types, with the exception of wind and demand response, performed poorly. PJM explained to the Commission that at the time of the peak demand hour on January 7:

- approximately 22 percent of total installed generation capacity in PJM (of all fuel types) was unavailable because of forced outages associated with routine equipment breakdowns, problems related to operating in extreme cold temperatures and, fuel-supply issues.
- gas interruptions were *not* the major driver of the high forced outage rates experienced in the PJM region.
- Natural gas interruptions removed less than five percent of the total capacity required to meet demand on January 7
- Equipment issues associated with both coal and natural gas units made up the far greater proportion of forced outages⁷

To be sure, the 2014 Polar Vortex exposed some electric industry vulnerabilities associated with the transportation of natural gas to generators in the PJM region. This is a work in progress.

PJM has taken a number of actions since the 2014 Polar Vortex to improve generation performance, many of which were implemented by winter of 2015 and did result in a reduction in total forced outages of 15,395MWs (38.3%) on the two dates shown in Figure 1 below under similar temperature, weather and system loads.

⁷ *Winter 2013-2014 Operations and Market Performance in Regional Transmission Organizations and Independent System Operators*, Statement of Michael J. Kormos Executive Vice President – Operations, PJM Interconnection, L.L.C. at 3-4, Docket No. AD14-8-000 (May 15, 2014) (“Kormos Statement”).

Figure 1: Comparison of Outages by Primary Fuel⁸

Figure 19. Outages by Primary Fuel Feb. 20, 2015

Figure 20. Outages by Primary Fuel Jan. 7, 2014

Changes implemented in advance of the 2015 winter included:

- Development of a Cold Weather Preparation Guideline and Checklist.
 - Utilized annually to prepare generators for extreme cold weather
 - PJM Manual 14D: Attachment N
- Implementation of the Generation Resource Operational Exercise.

⁸ See *2015 Winter Report* at 21 (May 13, 2015) which can be found at <http://pjm.com/-/media/library/reports-notices/weather-related/20150513-2015-winter-report.ashx?la=en>.

- PJM identifies units that did not operate, or operate on its alternate fuel, in the 8 weeks prior to Nov 1st, and also on a rolling two week basis through mid-December, and will schedule a test of the unit to ensure operability on either the primary or alternate fuel.
- PJM also provides cost recovery for the tests for any non-Capacity Performance units.
- Improved generator fuel supply surveys with enhanced focus on fuel supply and emissions limitations.
- Improved gas-electric coordination including secure data exchange with information sharing of pipeline restrictions and gas fired generation nominations in the day ahead market.
- Improved tools for better situational awareness with a geographic information system including gas pipelines and associated generation and locational visibility to curtailable load in the Dispatch Interactive Mapping application.

These actions by PJM as well as the generation owners to improve generator performance and communications were effective in reducing generator outages. In many cases however, these actions are voluntary and thus PJM has taken other steps to improve performance.

For instance, PJM evolved its capacity market to the Capacity Performance construct which is aimed at incentivizing performance not by proscribing specific requirements for each fuel type, but, rather, incentivize better performance in a resource-neutral way. Through stricter performance requirements, incentives and charges for non-performance, Capacity Performance holds capacity resources accountable to make the necessary investments and operational improvements required to ensure delivery of energy when needed most. These investments include not only firming fuel supply, and investing in dual-fuel capability (which combines back-up oil fuel with primary natural gas fuel), but also will also provide incentive to make investments to ensure the generator equipment itself will perform better under extreme cold (more insulators, heaters, etc.), increased staffing, capital investments for better operational flexibility, and cold-weather testing on alternate fuels. These investments are based on risks to performance that a resource can anticipate, plan for, budget for and implement.

Another area in which PJM has made improvements relates to the operating challenges that the daily market timing differences in the two industries pose for generators scheduling gas. In effect, gas delivery to generators begins ten hours after PJM's operating day begins at midnight. Generators must straddle two consecutive gas operating days to cover one electric operating day, thus complicating gas procurement for generation. To mitigate this operational challenge and at the direction of the Commission in Order No. 809,⁹ PJM changed the timing of the Day-Ahead

⁹ *Coordination of the Scheduling Processes of Interstate Natural Gas Pipelines and Public Utilities*, Final Rule, 151 FERC ¶ 61,049 (2015).

Market to better align with the natural gas pipelines' nomination timelines. Under the new schedule, PJM posts Day-Ahead Market results by no later than 1:30 p.m. eastern, which is in advance of a new 2 p.m. eastern Timely Nomination cycle deadline for generators to procure the delivery of natural gas to their units. These changes went into effect on April 1, 2016.

As a result of the described changes, PJM believes it is well prepared for an extreme winter event.

Question 3

The proposed rule also references the impacts of other extreme weather events, specifically hurricanes Irma, Harvey, Maria, and superstorm Sandy. Do commenters agree with the proposed rule's characterization of these events? For extreme events like hurricanes, earthquakes, terrorist attacks, or geomagnetic disturbances, what impact would the proposed rule have on the time required for system restoration, particularly if there is associated severe damage to the transmission or distribution system?

PJM Response

As explained in more detail in the body of PJM's comments¹⁰ PJM does not agree with the proposed rule's characterization of the listed weather events. To the contrary, extreme weather events impact distribution and in some cases transmission much more readily than generation resources' operational failures or lack of fuel supply. And, as a result of the impacts to the transmission and distribution systems, generation resources typically are rendered undeliverable during and immediately following such weather events, regardless of the status of the resource itself.

This point is supported by NERC's "Hurricane Sandy Event Analysis Report," which evaluated the storm's impact on the bulk power system, including both generation and transmission assets. NERC found that "[w]hile there was sufficient generation capacity available to meet the load as restoration progressed; there were some cases where customer restoration was hindered by local area transmission outages."¹¹ NERC's evaluation found that "[o]ver the course of the event, 20,007 MW of generation capacity was rendered unavailable,"¹² including what

¹⁰ PJM Comments at section II.A.

¹² *Id.*

DOE calls “fuel secure” nuclear, coal, and other fossil fuel resources.¹³ The same can be said with respect to the devastation caused by hurricane Maria, where roughly 80% of the transmission system in Puerto Rico is above ground, and they lost approximately 75% percent of that infrastructure (in other words, 60% of all their transmission towers/lines were knocked down). As far as distribution goes, the loss was higher with about 85% of all lines/pole damaged or destroyed. The lead time associated with getting those pieces back is the true reason behind the length of this outage. Capacity was available within 72 hours of the event (and still is), but they can’t get it connected to load.

Another factor that underscores the lack of basis concerning the DOE NOPR is that coastal nuclear facilities located in the PJM Region adhere to varying protocols whereby they may choose to shut down when sustained high winds, in some cases as low as 42 MPH, are expected.

Question 4

The proposed rule references the retirement of coal and nuclear resources and a concern from Congress about the potential further loss of valuable generation resources as a basis for action. What impact has the retirement of these resources had on reliability and resilience in RTOs/ISOs to date? What impact on reliability and resilience in RTOs/ISOs can be anticipated under current market constructs?

PJM Response

Resource diversity is a valid topic of study, and PJM regularly examines the potential reliability impacts of a changing resource mix, including impacts associated with coal plant retirements driven by the high compliance costs of the United States Environmental Protection Agency’s Mercury and Air Toxics Standards. As discussed above, the retirement of those resources has had no significant impact on reliability as defined by the relevant NERC criteria, and PJM has not identified the retirement of coal and nuclear resources as a material reliability concern under current market constructs. As discussed in the Evolving Resource Mix and Reliability Report, PJM can operate reliably at much higher levels of natural gas and renewables, and much lower levels of coal and nuclear. PJM’s analysis revealed that operational reliability would be maintained even if all coal and nuclear resources in the expected near-term portfolio retire, and are replaced exclusively by natural gas.¹⁴

¹³ NERC also identified “[s]everal generation operation risks” from the storm, including: (1) increased potential for Loss of Off-site Power to nuclear facilities; (2) possibility of LOOP due to switchyard damage, or loss of normal condenser cooling and loss of availability of service water due to high water; (3) precipitator fly ash buildup and higher gas flow pressure due to operating without auxiliary feeds; (4) curtailments due to wet coal, which is normal with any significant precipitation; (5) danger from the loss of building siding; and (6) potential lack of fuel due to damage to the fuel provider’s facilities. *Id.* at 23.

¹⁴ See PJM’s *Evolving Resource Mix and System Reliability* at 5 & n.15 (March 30, 2017) (“Evolving Resource Mix and Reliability Report”), which can be found at the following URL: <http://www.pjm.com/~media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx>

“Resilience” (or lack thereof) within the resource context, as distinguishable from reliability, was not adequately defined in the DOE NOPR, but PJM understands it generally as a risk metric that potentially could be addressed through resource portfolio diversification. Therefore, in a theoretical sense, some improved measure of resource or fuel diversity or flexibility could potentially improve resilience because of a more diversified portfolio of resilience-related attributes, however identified or defined. For example, on-site liquid fuel for dual-fuel combustion turbines, as acknowledged under PJM’s Capacity Performance construct, narrowly could be viewed as a resilience-related attribute under some reliability scenarios associated with the natural gas pipeline infrastructure and gas-electric coordination. However, resilience, as distinct from reliability, typically is not viewed only within a narrow resource context. Instead, resilience typically is viewed within the context of the entire bulk electric system, and relates to preparing for, operating through, and recovering from a high-impact, low frequency event.¹⁵ Resilience involves protecting the bulk electric system as a whole and must take into consideration myriad aspects of the system such as transmission and distribution infrastructure, fuel security such as through gas/electric coordination, markets, physical and cyber security, and advanced system restoration. Therefore, the DOE NOPR’s emphasis on resilience as a resource issue is mostly misplaced.

Question 5

Is fuel diversity within a region or market itself important for resilience? If so, has the changing resource mix had a measurable impact on fuel diversity, or on resilience and reliability?

PJM Response

Yes, fuel diversity within a region or market is important for resilience. The current resource mix in PJM is the most fuel diverse it has ever been, and recent changes in the resource mix have positively impacted fuel diversity by incorporating a larger percentage of natural gas and renewables. If we proceed from the theoretical proposition that portfolio diversity reduces risk, we can reasonably surmise that PJM’s increased fuel diversity, and the flexibility it provides, has *reduced* resilience and reliability risks. However, as indicated in the Evolving Resource Mix and Reliability Report, more focused research on the topic of resilience may be needed, including identifying and defining resilience attributes.¹⁶

Indeed, while PJM has taken steps such as its Capacity Performance reforms and winter preparedness in response to the extreme weather conditions during the 2014 Polar Vortex, PJM believes more work should be undertaken with respect to ensuring resource performance and fuel security. That is, even though PJM’s resource mix is diverse, PJM will continue efforts to review system resilience from a fuel security perspective and will continue to evaluate generation performance incentives.

¹⁵ See *Id.* at 5 and n.16.

¹⁶ *Id.* at 6-7.

II. Eligibility

A. General Eligibility Questions

Question 1

In determining eligibility for compensation under the proposed rule, should there be a demonstration of a specific need for particular services? What should be the appropriate triggering and termination provisions for compensation under the proposed rule?

PJM Response

Yes, there must be a demonstration of need to support compensating any resource on our system on an out-of-market basis for any wholesale service it provides. RMR agreements today need to be justified before the Commission and are limited both in scope and duration. PJM does not believe that a sweeping designation of all units, irrespective of their location, cost structure or performance record is an appropriate substitute for market-based solutions and the very limited and targeted out-of-market solutions as a backstop. For all the reasons presented in the body of PJM's comments¹⁷ PJM does not believe there has been a demonstration of need for the proposed cost-of-service compensation to, in effect, coal and nuclear resources.

Nevertheless, to the extent the Commission seeks to value the resilience attributes of a resource through a cost-of-service rate, an approach similar to a reliability must run¹⁸ concept, which is in place today, could, under certain limited circumstances under RTO-specific rules, could provide a far more appropriate model. First, there would need to be well-defined criteria for determining if the resource is, in fact, needed for resilience to ensure a resource is actually needed for such service. Second, just like PJM's reliability must run provisions which are time-limited to the time between when a resource would seek to retire, and the time it takes to mitigate the impact of such retirement, so too should any RMR-like cost recovery be limited to the time in which the resilience attributes defined by the criteria are replaced.

Question 2

As the proposed rule focuses on preventing premature retirements, should a final rule be limited to existing units or should new resources also be eligible for cost-recovery? Should it also include repowering of previously retired units? Alternatively, should there be a minimum number of MW or a maximum number of MW for resources receiving cost-of service payments

¹⁷ PJM Comments at section II.A., B., and C.

¹⁸ PJM's reliability must run rules are contained in the deactivation section of its Open Access Transmission Tariff ("Tariff"), Part V. These rules provide a mechanism for compensating a generation resource to remain on line despite a documented plan to retire, if loss of such unit presents a reliability issue. But, the compensation is provided only until such time any reliability mitigation measures, such as a new generation resource coming on line or a transmission solution is in service, are in place.

for resilience services? If so, how should RTOs/ISOs determine this MW amount? Should this also include locational and seasonal requirements for eligible resources?

PJM Response

PJM does not agree with the premise of the proposal.

Question 3

Are there other technical characteristics that should be required for an eligible unit besides on-site fuel capability? If so, what are those technical characteristics and what benefits do they provide? What types of resources can meet the proposed eligibility criteria of the proposed rule? What proportion of total current generating capacity does this represent?

PJM Response

See prior responses in this section.

Question 4

If technically capable of sustaining output for a sufficient duration (and meeting other relevant requirements), should resources such as hydroelectric, geothermal, dual-fuel with adequate on-site storage, generating units with firm natural gas contracts, or energy storage (each of which might have a demonstrable store of energy to draw upon to sustain an electrical output, if not necessarily fuel) also be eligible? Why or why not? If technical capability is the appropriate criterion for eligibility, what specific technical capability should be required to be eligible?

PJM Response

The Staff's noting of the attributes of these particular resources in this question points out the unworkability of the DOE's arbitrary designation of a more narrow set of resources when different types of units provide different but needed reliability attributes to differing degrees.

Question 5

The proposed rule would require that eligible resources be able to provide essential energy and ancillary reliability services and includes a non-exhaustive list of services. What specific services should a resource be required to provide in order to be eligible?

PJM Response

See response to prior questions in this section.

Question 6

The proposed rule would limit eligibility to resources that are not subject to cost of service rate regulation by any state of local regulatory authority. How should the Commission and/or RTOs/ISOs determine which resources satisfy this eligibility requirement?

PJM Response

The DOE NOPR requires an examination of the regulatory structure as well as revenue streams available to individual coal and nuclear units. This is not an easy task given that in a number of cases, states do not operate under pure cost of service ratemaking which ties specific dollars to specific plants. As a result of rate settlements and the bundled nature of ratemaking, returns are not established on a unit by unit basis in the state ratemaking process. For this reason, PJM is not clear how the DOE intends FERC to actually implement this identification. Nevertheless, this examination and categorizing of different regulatory regimes is not a matter that should be assigned to the RTOs as it is outside of their core mission or area of expertise.

B. 90-day Requirement

Question 1

The proposed rule defines eligible resources as having a 90-day fuel supply. How should the quantity of a given resource's 90 days of fuel be determined? For example, should each resource be required to have sufficient fuel for 24 hours/day and sustained output at its upper operating limit for the entire 90-day period? Would there be any need for regional differences in this requirement?

PJM Response

For the reasons stated in PJM's response to the question on the Need for Reform, as well as discussed in the body of PJM's comments PJM does not believe there is a basis for the DOE's proposal. That said, the 90-day requirement is arbitrary at best. For instance, recent studies, including the Black Sky/Black Start Protection Initiative, suggest that 30 days of fuel inventory would be required to adequately respond to Black Sky type events.¹⁹ And, even if a resource has 90 days of supply, it does not mean it will be able to operate during extreme weather events where a coal pile freezes or the threat of sustained high winds may cause a nuclear facility to shut down, as discussed above.

¹⁹ See Black Sky/Black Start Protection Initiative which can be found at the following URL:
http://eiscouncil.org/App_Data/Upload/BSPI.pdf

Question 2

Is there a direct correlation between the quantity of on-site fuel and a given level of resilience or reliability? Please provide any pertinent analyses or studies. If there is such a correlation, is 90 days of on-site fuel necessary and sufficient to address outages and adverse events? Or is some other duration more appropriate?

PJM Response

PJM is not aware of any such showing.

C. Fuel Supply Requirement

Question 1

The proposed rule requires that resources must be in compliance with all applicable environmental regulations. How should environmental regulations be considered when determining eligibility? For example, if a unit that was capable of keeping 90-days of fuel on-site was subject to emission limits that would prevent it from running at its upper operating limit for 90 days, should that unit be eligible under this proposed rule?

PJM Response

For the reasons stated in PJM's response to the question on the Need for Reform, as well as discussed in the body of PJM's comments PJM does not believe there is a basis for the DOE's proposal. Nevertheless, environmental restrictions should be taken into account when evaluating the eligibility of a resource to be compensated pursuant to a well-defined resilience reason (which resilience criteria is lacking in the DOE NOPR). Absent the ability for the generator to run for 90-days without being emissions restricted, it would not make sense to guarantee 100% compensation for a unit that is environmentally related.

Question 2

As the proposed rule references the need for resilience due to extreme weather events, including hurricanes, should there be any other eligibility criteria for the resource or fuel supply (e.g., storm hardening)? What considerations should be given to the vulnerability of 90-day fuel supplies to natural or man-made disasters such as extreme cold temperatures, icing, flooding conditions, etc. that may impact the on-site fuel supply?

PJM Response

It is unclear to PJM how the 90-day fuel supply requirement proposed by the DOE will improve resilience during extreme weather events. Recent examples of hurricanes Sandy and Maria have shown that the distribution system as well as the transmission system are limiting factors in maintaining electricity delivery to loads during extreme weather events. PJM believes that shifting the focus to hardening the distribution network and enhancing the planning requirements

of the transmission system to include such severe weather events would have a much more significant impact on the resilience of the power system.

Question 3

Does the vulnerability or non-availability of on-site fuel supplies vary depending upon fuel type, location, region, or other factors?

PJM Response

Fuel type is just one component of a unit's availability in a given situation. One cannot generalize to 'select' one set of fuels over another. Rather, PJM urges consideration of analysis of reliability attributes consistent with PJM's recent analysis.²⁰ Ongoing review of fuel security and generation performance is also important to ensure a resilient system. That analysis was cited approvingly in the DOE August study but seems to have been disregarded for purposes of the DOE proposed NOPR.

III. Implementation

Question 1

How would eligible resources receiving cost of service compensation under the proposed rule be committed and dispatched in the energy market?

PJM Response

Such resources should be required to offer into the energy market at no less than their actual cost. Because such resources would be receiving cost of service compensation, they may have an incentive to offer into the energy market at below their actual cost. Doing so, however, would inappropriately suppress energy market prices, thereby distorting the price signals provided by the market for efficient resource entry and exit.

The DOE NOPR overlooks the fact that even with full cost of service recovery for the existing nuclear and coal fleet, PJM will still need to call on merchant generation in order to meet load in many hours. Yet the DOE subsidy of these units does serious violence to the market signal which the market is intended to send as to the value of all resources. Moreover, it will be harder to attract capital for new merchant generation which still will be needed to meet load, given that investors will flock to the new 'guarantee' created by DOE.

Question 2

How would eligible resources receiving cost based compensation under the proposed rule be considered in the clearing and pricing of centralized capacity markets?

²⁰ Evolving Resource Mix and Reliability Report.

PJM Response

Such resources should be required to offer into centralized capacity markets at no less than their actual going forward costs. Alternatively, resources could offer into these markets at below their going forward costs, if the market operator has adopted a mechanism by which the clearing price determined in those markets can be reconstituted to the competitive price for the purpose of compensating all unsubsidized resources in the market. Not adopting one of these two requirements would result in inappropriate price suppression in the capacity markets that would distort price signals and interfere with the markets' ability to drive efficient resource entry and exit.

However, even with these market safeguards, the distorting impact of the DOE subsidy will discourage investment in the kind of resources that do not meet the DOE-defined eligible class even though they will continue to be needed to meet load demands.

Question 3

What is the expected impact of this proposed rule on entry of new generation, reserve margins, retirement of existing resources, and on resource mix over time?

PJM Response

To the extent these resources are uneconomic and would otherwise retire and exit the market, even with the above protections the rule would have a negative impact on the markets' ability to drive efficient resource entry and exit. The continued operation of uneconomic resources in the market due to the presence of outside-the-market subsidies suppresses clearing prices, erodes investor confidence and stifles the innovation that has made the market successful and resulted in more reliable electric service at the lowest reasonable cost to consumers.

The impact on the reserve margin is dependent on the performance of the resources. To the extent the performance is, on average, worse than the average performance of the PJM fleet, then it will increase the Installed Reserve Margin.

Question 4

Should there be performance requirements for resources receiving compensation under the proposed rule? If so, what should the performance requirement be, and how should it be measured, or tested? What should be the consequence of not meeting the performance requirement?

PJM Response

Yes, the performance requirements on such resources should be identical to the performance requirements applied to all units in the market. Further, and critically, any penalties for non-performance, whether financial or physical, should not be recoverable through the cost-of-service rates envisioned in the rule. Allowing such recovery of performance penalties would

nullify the intended impact of the penalties to drive resource performance that supports system reliability.

Question 5

Should there be any restrictions on alternating between market-based and cost-based compensation?

PJM Response

This should be a one-time choice for any given unit. To allow switching between compensation methods would invite gaming by market participants based upon expectations as to where the greatest revenue could be earned at the expense of load.

IV. Rates

Question 1

The proposed rule lists compensable costs that should be included in the rate as operating and fuel expenses, costs of capital and debt, and a fair return on equity and investment. Are there other costs that would be appropriate to be included in the rate? Would any of the listed costs be inappropriate for inclusion?

PJM Response

PJM does not take a position on this question.

Question 2

Should wholesale market revenues offset any cost of service payments stemming from the proposed rule?

PJM Response

Although clearly wholesale revenues should be offset from cost of service recovery to avoid over-recovery, the distorting impact of this 'true up' for a select set of 'eligible' resources points out the discriminatory and unworkable nature of the DOE proposal.

Question 3

How should RTOs/ISOs allocate the cost of the proposed rule to market participants?

PJM Response

While PJM does not believe that the proposed rule meaningfully improves reliability or resilience, if it is accepted, it will be on the belief that it does. Therefore, if accepted, the costs should be allocated to the expected beneficiaries which would be real-time load and exports. Further, because the proposal is sweeping and requires compensation without regard to the locational value of any eligible resource, an allocation pro-rata across all load and exports would be consistent with the sweeping nature of the proposal itself given that it is difficult to identify specific loads as benefiting more than others from the DOE proposal and allocating costs along traditional “cost causation” grounds.

Question 4

How would the requirement that eligible resources receive full cost recovery be reconciled with the requirement, as stated in the regulatory text, that resources be dispatched during grid operations?

PJM Response

This question points out another inconsistency in the DOE proposal. Units are entitled to receive ‘full cost recovery’ including a return irrespective of whether they actually operate. The only way to reconcile this is to limit recovery to those hours when the units are determined to be needed to meet specific locational or system-wide reliability conditions during emergencies. Of course, this limitation appears inconsistent with the DOE’s proposal making the two difficult to reconcile.

V. Other

Question 1

The proposed requirement for submitting a compliance filing is 15 days after the effective date of any Final Rule in this proceeding, with the tariff changes to take effect 15 days after the compliance filings are due. Please comment on the proposed timing, both to develop a mechanism for implementing the required changes and to implement those changes, including whether or not such changes could be developed and implemented within that timeframe.

PJM Response

PJM incorporates by reference the response of the ISO/RTO Council to this question.

Question 2

Please comment on the proposed rule’s estimated burden of \$291,042 per respondent RTO/ISO, to develop and implement new market rules as proposed, including the potential software upgrades required to do so.

PJM Response

PJM incorporates by reference the response of the ISO/RTO Council to this question.

Question 3

Please describe any alternative approaches that could be taken to accomplish the stated goals of the proposed rule.

PJM Response

Please refer to the body of PJM's comments in section III concerning PJM's review of price formation reforms for the PJM Region.

Question 4

What impact would the proposed rule have on consumers?

PJM Response

Given the lack of details provided in the DOE NOPR, and the extremely short time frame in which to provide comments, PJM has not conducted analyses to provide a meaningful response to this question.

Question 5

The Commission may take notice of relevant public information, including information in other Commission proceedings. If a commenter views information in another Commission proceeding as relevant to the proposed rule, please identify that information and explain how it is relevant to the proposed rule. Such information may include a filing previously submitted by the commenter.

PJM Response

Below is a partial list of public information and Commission proceedings relevant to the proposed rule. Please also refer to the various proceedings and reports referenced throughout the body of PJM's comments.

(1) PJM's October 19, 2017 presentation to the Commission on winterization, which includes information on PJM's resilience-related activities and studies associated with gas-electric coordination, natural gas pipeline modeling and contingencies, cyber security, and potential storm surge impacts, <https://www.ferc.gov/industries/electric/indus-act/rto/10-19-17-A-4-PJM.pdf>. This information is relevant to the proposed rule because it demonstrates the scope and breadth of PJM's resilience-related activities, unrelated to an arbitrary on-site fuel requirement for favored resources.

(2) PJM's report on price formation issues submitted on February 17, 2016 in Docket No. AD14-14-000, *Price Formation in Energy and Ancillary Services Markets in Regional Transmission Organizations and Independent System Operators*, which summarize PJM's price formation issues and activities up to that time. The report is relevant to the proposed rule because it provides information on PJM's price formation efforts to promote resource flexibility and performance, as discussed in these comments.

(3) PJM's Report on Fuel Assurance Activities, submitted on February 18, 2015 in Docket No. AD14-8-000, *Winter 2013-2014 Operations and Market Performance in Regional Transmission Organizations and Independent System Operators*, in which PJM reported on the status of its efforts to address market and system performance issues associated with generator access to sufficient fuel supplies and the firmness of generator fuel arrangements. These fuel assurance activities are relevant to the proposed rule because they represent concrete actions that PJM already has taken to ensure fuel availability during extreme events, such as potential events similar to the Polar Vortex.

(4) The Commission proceedings in Docket Nos. ER15-623 and EL15-29 regarding PJM's Capacity Performance construct, which better ensures that committed capacity resources will perform when called upon to meet the reliability needs of the PJM region. The Capacity Performance construct is relevant to the proposed rule because it demonstrates concrete action that PJM already has taken to ensure resource availability and reliability during extreme events, such as potential events similar to the Polar Vortex.

(5) PJM's post-technical conference comments submitted on May 15, 2014 in Docket No. AD14-8-000, *Winter 2013-2014 Operations and Market Performance in Regional Transmission Organizations and Independent System Operators*, which reference the PJM report entitled *Analysis of Operational Events and Market Impacts during the January 2014 Cold Weather Events*, <http://www.pjm.com/~media/library/reports-notice/weather-related/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx> (May 8, 2014). The comments and report are relevant to the proposed rule because they describe actual extreme events, associated with the Polar Vortex, to which PJM already has responded with concrete action to ensure resource availability and reliability.

APPENDIX B
to
PJM COMMENTS IN RM18-1-000
OCTOBER 23, 2017

October 23, 2017

Mr. Stu Bresler
Senior Vice President Operations & Markets
PJM Interconnection
2750 Monroe Blvd
Audubon, PA 19403

SUBJECT: PJM Price Formation

Dear Mr. Bresler:

I participated with the PJM staff and Board members in the discussion of an important initiative in the evolution of the PJM energy market. PJM staff is proposing to reform the existing pricing model in order to ensure that the incremental cost of serving load is reflected in LMP to the fullest extent possible, uplift is reduced and incentives are maintained. This follows the principles of sound market design. Enhanced energy market price signals will strengthen performance incentives in PJM's markets and is complementary to other reforms being considered by PJM. Given my knowledge of the PJM resource profile, this reform would be an appropriate step forward in price formation for the PJM region.

The market design in PJM follows the basic principles of bid-based, security-constrained, economic dispatch with locational prices. This design is the only approach that is consistent with an efficient energy market under the principles of open-access and non-discrimination. A crucial element of this model is that the prices and related payments support the efficient dispatch. In particular, it serves to achieve the goal that market participants who take prices as given would have no incentive to deviate from the dispatch, and would help make bids and offers consistent with their underlying costs.

The foremost element of this market design is the use of locational marginal prices. Under certain simplifying assumptions, these locational marginal prices provide all that would be needed to support the efficient dispatch. Relying on the locational marginal prices has served the PJM markets well for many years, even though in some circumstances additional payments have been required.

Mr. Stu Bresler
October 23, 2017
Page 2

I have discussed with PJM staff the circumstances that deviate from the simplifying assumptions required for locational marginal prices alone to provide full support for efficient operations. Most prominent are conditions where the problem expands to include commitment decisions with start-up costs and associated constraints such as minimum output levels and minimum run-times. Under these conditions, locational marginal prices alone cannot always be guaranteed to support the efficient outcome and additional associated payments are made that must be recovered as part of an “uplift” charge. The additional payments in aggregate equal the foregone profits from following the dispatch. PJM has explained that within the PJM region, its resource profile, flattening price curves and reduced infra-marginal rents have brought the limitations of the locational marginal prices to the forefront and that the PJM market as a whole would benefit from the proposed enhancements for price formation.

The use of locational prices is still indicated, but the choice of these prices has effects on the amount of the uplift. There is an argument for choosing the locational prices, that cover the bulk of the energy revenues, to come as close as possible to minimizing the need for the additional uplift payments. As I have discussed with PJM staff, this ideal case both supports the dispatch and minimizes the uplift.¹ However, this approach presents computational requirements that would be challenging under the best of circumstances, and even more difficult to apply in the short intervals required for the real-time spot market.

A natural approximation to the minimum-uplift model is available in the “integer relaxation,” as PJM intends to propose. This approach employs a pricing model that relaxes the complicating commitment constraints and restores the simplifying assumptions to ensure that the marginal price of the system will not decrease when demand increases. The locational marginal prices from this relaxed model would be easy to obtain. Under certain conditions, the prices from the integer relaxation would be the associated minimum-uplift prices. In general, the integer-relaxation prices should be close to providing the minimum uplift results.

Importantly, the enhanced price formation PJM intends to propose would be compatible with other reforms that are part of the larger discussion in PJM. For example, the enhanced pricing would be extended in practice to deal with multi-period problems where ramp rates and other flexibilities are important. Furthermore, the enhanced pricing model could accommodate improved scarcity pricing which should play a prominent role in adapting to changing market conditions with increasing supplies of intermittent or distributed resources.

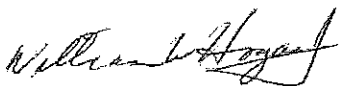

I support the energy pricing method PJM intends to propose. But I do not expect it likely to produce a dramatic change or have as significant an impact as improved scarcity pricing. Currently PJM’s rules for shortage pricing do not accurately value energy and reserves during

¹ This is known as the “minimum uplift” or “convex hull” approach. See (Gribik, Hogan, & Pope, 2007).

Mr. Stu Bresler
October 23, 2017
Page 3

reserve shortages. Based on the current penalty factors, the value of energy and reserves do not approach the estimated value of lost load (VOLL). Additionally, PJM's demand curves do not articulate the reliability value of reserves to the system. To fully address price formation, reforms are required to PJM's shortage pricing approach as well. Nonetheless, PJM's proposal to implement integer relaxation is a beneficial and essential first step toward solving the bigger issue of a more comprehensive enhancement of energy and reserve price formation. And given the circumstances faced by PJM as described above, I am supportive of this approach as a reasonable and appropriate step to be proposed by PJM as a means to address needed price formation reforms in the PJM market.

Very truly yours,

William W. Hogan²

FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Kevin J. McIntyre, Chairman;
Cheryl A. LaFleur, Neil Chatterjee,
Robert F. Powelson, and Richard Glick.

Grid Reliability and Resilience Pricing

Docket Nos. RM18-1-000

Grid Resilience in Regional Transmission Organizations
and Independent System Operators

AD18-7-000

ORDER TERMINATING RULEMAKING PROCEEDING,
INITIATING NEW PROCEEDING,
AND ESTABLISHING ADDITIONAL PROCEDURES

(Issued January 8, 2018)

1. The Commission previously has taken steps with regard to reliability and other matters that have helped to address the resilience of the bulk power system. The Commission recognizes that we must remain vigilant with respect to resilience challenges, because affordable and reliable electricity is vital to the country's economic and national security. As explained below, we are terminating the proceeding we initiated in Docket No. RM18-1-000 to address the Proposed Rule on Grid Reliability and Resilience Pricing (Proposed Rule) submitted to the Commission by the Secretary of Energy.¹ Nonetheless, we appreciate the Secretary reinforcing the resilience of the bulk power system as an important issue that warrants further attention. To that end, we are initiating a new proceeding in Docket No. AD18-7-000 to specifically evaluate the resilience of the bulk power system in the regions operated by regional transmission organizations (RTO) and independent system operators (ISO). In this order, we direct each RTO and ISO to submit information to the Commission on certain resilience issues and concerns identified herein to enable us to examine holistically the resilience of the bulk power system. The resilience of the bulk power system will remain a priority of this Commission. We expect to review the additional material and promptly decide whether additional Commission action is warranted to address grid resilience.

¹ *Grid Resiliency Pricing Rule*, 82 Fed. Reg. 46,940 (Oct. 10, 2017).

I. Proposed Rule

2. On September 29, 2017, the Secretary submitted the Proposed Rule pursuant to section 403 of the Department of Energy (DOE) Organization Act. The Proposed Rule directed the Commission to consider requiring certain RTOs and ISOs to establish a tariff mechanism providing for: (1) the purchase of energy from an eligible “reliability and resilience resource;” and (2) the recovery of costs and a return on equity for such resources (i.e., a “resilience rate”). The Proposed Rule stated that eligible reliability and resilience resources must be: (1) located in an RTO/ISO with an energy and capacity market; (2) be able to provide essential reliability services;² and (3) have a 90-day fuel supply on-site.
3. As the basis for these requirements, the Proposed Rule cited: (1) significant retirements of baseload generation, particularly coal and nuclear resources; (2) the 2014 Polar Vortex, which the Proposed Rule states exposed problems with the resilience of the grid; and (3) a growing recognition that organized markets do not compensate resources for all of the attributes they contribute to the grid, including resilience.
4. The Secretary directed the Commission to consider and take final action on the Proposed Rule within 60 days of the date of publication in the Federal Register, or, alternatively, to issue the DOE’s proposed rule as an interim final rule immediately, with provision for later modification after consideration of public comments.
5. The Commission initiated Docket No. RM18-1-000 to consider the Proposed Rule. The Commission issued a Notice Inviting Comments on the Proposed Rule on October 2, 2017, with initial comments due on October 23, 2017, and reply comments due on November 7, 2017.³ In addition, on October 4, 2017, the Director of the Commission’s Office of Energy Policy and Innovation issued a request for information seeking responses and comment on a number of specific questions raised by the Proposed Rule.⁴ The Commission received extensive comments and reply comments in response to the Proposed Rule and the Staff Request for Information from a wide variety of interested stakeholders, including utilities, generators, federal and state legislators, state regulatory

² The essential reliability services were to include, but not be limited to: voltage support, frequency services, operating reserves, and reactive power. Proposed Rule at 18.

³ *Grid Reliability and Resilience Pricing*, Notice Inviting Comments (Oct. 2, 2017).

⁴ *Grid Reliability and Resilience Pricing*, Staff Request for Information (Oct. 4, 2017).

agencies and state attorneys general, industrial customers, environmental organizations, mining companies, other industries, and individuals.

6. On December 7, 2017, the Chairman of the Commission proposed to the Secretary of Energy that a 30-day extension be granted to address the Proposed Rule. On December 8, 2017, the Secretary of Energy responded, granting the extension and thereby giving the Commission until January 10, 2018, to address the Proposed Rule.

II. Discussion

A. Background

1. Evolution of the Electric Power Industry

7. To more fully understand the context in which the Proposed Rule was issued and the actions we are taking here, it is important to recount briefly the structural and operational origins and evolution of the electric power industry. Historically, vertically integrated utilities generally built and owned the generation, transmission, and distribution facilities needed to serve load within their respective defined service territories. Utilities constructed generation facilities that they determined were best suited to meet that load. Utility rates were historically regulated by federal and state regulators on a cost-of-service basis; the utilities charged for electric generation at rates calculated to compensate them for their actual costs plus a fair rate of return. In other words, during this early period, there was no market structure as we understand it in today's electric power industry.⁵

8. Beginning in the 1970s, statutory and regulatory developments at the federal and state level encouraged the development of competitive electricity markets, including encouraging the growth of non-utility generators.⁶ In 1996, this Commission issued its

⁵ The Commission's Order No. 888, discussed below, recounts the historical landscape following enactment of the Federal Power Act (FPA) in 1935. *See Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities; Recovery of Stranded Costs by Public Utilities and Transmitting Utilities*, Order No. 888, FERC Stats. & Regs. ¶ 31,036, at 31,639-31,645 (1996).

⁶ For instance, the Public Utility Regulatory Policies Act of 1978 and the Energy Policy Act of 1992 helped spur competition in the electric power industry. Additionally, the Commission began authorizing entities to make electric power sales at market-based rates starting in the late 1980s. The market-based rate program continues to be a critical part of the Commission's electric regulatory responsibilities.

landmark Order No. 888,⁷ which required public utility transmission providers to provide open access transmission service and developed principles for the concept of ISOs and RTOs, and in 1999 the Commission issued Order No. 2000,⁸ which expressly encouraged the development of such regional entities with the intent of using such entities to foster competitive power markets. Meanwhile, starting in the 1990s, a number of states restructured their retail electricity markets to allow for more competition in the generation sector, which further contributed to development of bulk power markets and increased reliance on independent regional bodies for operation of the grid.

9. The traditional vertically integrated model was significantly affected by these developments, particularly in regions of the country where RTOs and ISOs manage the transmission grid. Notably, subject to Commission approval, RTOs/ISOs have developed organized markets for electric energy and ancillary services, and a number of them have also established centralized capacity markets. Thus, for more than two decades now, support for markets and market-based solutions has been a core tenet of Commission policy. A result of this approach has been that in regions with organized markets, the Commission has largely adopted a pro-market regulatory model, wherein the Commission relies on competition in approving market rules and procedures that, in turn, determine the prices for the energy, ancillary services, and capacity products (where applicable). Under this pro-competition, market-driven system, owners of generating facilities that are unable to remain economic in the market may take steps to retire or mothball their facilities.

10. A continually evolving phenomenon that has affected the development and evolution of electric markets is innovation in the energy sector and the change in the energy resource mix. As part of its ongoing oversight of wholesale electric markets, the Commission continues to evaluate its current rules and has issued several orders to ensure that our rates in our markets remain just and reasonable and not unduly discriminatory or

⁷ *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities; Recovery of Stranded Costs by Public Utilities and Transmitting Utilities*, Order No. 888, FERC Stats. & Regs. ¶ 31,036 (1996), *order on reh'g*, Order No. 888-A, FERC Stats. & Regs. ¶ 31,048, *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *order on reh'g*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in relevant part sub nom. Transmission Access Policy Study Group v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom. New York v. FERC*, 535 U.S. 1 (2002).

⁸ *Regional Transmission Organizations*, Order No. 2000, FERC Stats. & Regs. ¶ 31,089 (1999), *order on reh'g*, Order No. 2000-A, FERC Stats. & Regs. ¶ 31,092 (2000), *aff'd sub nom. Pub. Util. Dist. No. 1 v. FERC*, 272 F.3d 607 (D.C. Cir. 2001).

preferential. For example, the Commission has acted to remove barriers to the integration and participation of variable energy⁹ and demand response resources,¹⁰ as well as revising or expanding compensation opportunities for various grid services, such as frequency regulation.¹¹

11. The Commission's support of competitive wholesale electricity markets has been grounded in the substantial and well-documented economic benefits that these markets provide to consumers. In Order No. 890, for example, the Commission cited a DOE study that found that competition had reduced consumers' bills by billions of dollars a year, even as it found that additional savings could be achieved by removing congestion bottlenecks.¹² In Order No. 719, the Commission explained that effective wholesale competition protects consumers by "providing more supply options, encouraging new entry and innovation, spurring deployment of new technologies, promoting demand response and energy efficiency, improving operating performance, exerting downward pressure on costs, and shifting risk away from consumers."¹³ At the same time, however, the Commission has continued to ensure that reliability is at the forefront of its responsibilities. The Commission's endorsement of markets does not conflict with its oversight of reliability, and the Commission has been able to focus on both without compromising its commitment to either.¹⁴

⁹ *Integration of Variable Energy Resources*, Order No. 764, FERC Stats. & Regs. ¶ 31,331 (cross-referenced at 139 FERC ¶ 61,246) (2012).

¹⁰ *Demand Response Compensation in Organized Wholesale Energy Markets*, Order No. 745, FERC Stats. & Regs. 31,322 (cross-referenced at 134 FERC ¶ 61,187) (2011).

¹¹ *Frequency Regulation Compensation in the Organized Wholesale Power Markets*, Order No. 755, FERC Stats. & Regs. 31,324 (cross-referenced at 137 FERC ¶ 61,064) (2011).

¹² *Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, FERC Stats. & Regs. ¶ 31,241, at P 60 (2007) (citing DOE, National Transmission Grid Study (May 2002)).

¹³ *Wholesale Competition in Regions with Organized Electric Markets*, Order No. 719, FERC Stats. & Regs. ¶ 31,281, at P 1 (2008).

¹⁴ For example, the Commission has held that out-of-market actions may be warranted in certain instances to address demonstrated reliability concerns. The Commission has approved these actions, however, on a limited basis, only as a last resort, and only after there has been a specific showing of an immediate reliability need. *See*,

2. The Commission's Efforts to Help Ensure Bulk Power System Resilience

12. The Commission has taken action to address reliability and other issues with regard to the bulk power system that have helped with the bulk power system's resilience, even though we may not have used that particular term. For example, in response to the increasing use of natural gas for electric generation, the Commission conducted a multi-year effort to evaluate the coordination of wholesale natural gas and electricity market scheduling, resulting in significant improvements to those scheduling and coordination processes.¹⁵ The Commission has also specifically examined the grid's response to the events of the 2014 Polar Vortex,¹⁶ and how each RTO/ISO addresses fuel assurance.¹⁷ Critically, the Commission has also approved significant capacity market reforms in ISO New England, Inc. (ISO-NE) and PJM Interconnection, L.L.C. (PJM) that are designed to bolster performance from capacity resources and to help address fuel supply issues during periods of system stress.¹⁸ Those market reforms created financial

¹⁸ *See ISO New England Inc. and New England Power Pool*, 147 FERC ¶ 61,172 (2014), *reh'g denied*, 153 FERC ¶ 61,223 (2015), *appeal pending sub nom. New England Power Generators Ass'n v. FERC*, No. 16-1023 (D.C. Cir. filed Jan. 19, 2016). *See also*

incentives to enhance reliability during extreme operating conditions. While none of the Commission's efforts described above were specifically targeted at "resilience" by name, they were directed at elements of resilience, in that they sought to ensure the uninterrupted supply of electricity in the face of fuel disruptions or extreme weather threats. Further, the Commission has conducted significant work to address bulk power system reliability through the North American Electric Reliability Corporation (NERC) reliability standards, including its continued work on Critical Infrastructure Protection standards to protect the system against cybersecurity and physical security threats,¹⁹ as well as geomagnetic disturbances.²⁰

13. Notwithstanding these and other Commission efforts to address the resilience of the bulk power system, we conclude that resilience remains an important issue that warrants the Commission's continued attention, including through the development of a clear understanding of what each RTO/ISO currently does with respect to the assurance or strengthening of resilience and what more the RTOs/ISOs and the Commission could be doing on this issue. Accordingly, although we terminate the Proposed Rule proceeding as discussed below, we are not ending our work on the issue of resilience. To the contrary, we are initiating a new proceeding to address resilience in a broader context and are directing the RTOs/ISOs to provide information – followed by an opportunity for comment by any other interested entity – that will inform us as to whether additional actions by the Commission and the ISOs/RTOs are warranted with regard to resilience issues.

PJM Interconnection, L.L.C., 151 FERC ¶ 61,208 (2015), *reh'g denied*, 155 FERC ¶ 61,157 (2016), *aff'd sub nom. Advanced Energy Mgmt. All. v. FERC*, 860 F.3d 656 (D.C. Cir. 2017).

¹⁹ See *Physical Security Reliability Standard*, Order No. 802, 149 FERC ¶ 61,140 (2014); *Revised Critical Infrastructure Protection Reliability Standards*, Order No. 822, 154 FERC ¶ 61,037 (2016), *reh'g denied*, Order No. 822-A, 156 FERC ¶ 61,052 (2016); *Revised Critical Infrastructure Protection Reliability Standards*, Order No. 829, 156 FERC ¶ 61,050 (2016); *Cyber Systems in Control Centers*, Notice of Inquiry, FERC Stats. & Regs. ¶ 35,557 (2016); *Revised Critical Infrastructure Protection Reliability Standards CIP-003-7 – Cyber Security – Security Management Controls*, Notice of Proposed Rulemaking, 161 FERC ¶ 61,047 (2017).

B. Termination of Docket No. RM18-1-000

14. Having considered the Proposed Rule and the comments received in Docket No. RM18-1-000, we terminate the proceeding in Docket No. RM18-1-000. The FPA is clear: in order to require RTOs/ISOs to implement tariff changes as contemplated by the Proposed Rule, there must be a demonstration that the specific statutory standards of section 206 of the FPA are satisfied. Thus, there must first be a showing that the existing RTO/ISO tariffs are unjust, unreasonable, unduly discriminatory or preferential.²¹ Then, any remedy proposed under FPA section 206 must be shown to be just, reasonable, and not unduly discriminatory or preferential.²² For the reasons discussed below, the Proposed Rule did not satisfy those clear and fundamental legal requirements under section 206 of the FPA. Given those legal requirements, we have no choice but to terminate Docket No. RM18-1-000.

15. Neither the Proposed Rule nor the record in this proceeding has satisfied the threshold statutory requirement of demonstrating that the RTO/ISO tariffs are unjust and unreasonable. While some commenters allege grid resilience or reliability issues due to potential retirements of particular resources,²³ we find that these assertions do not demonstrate the unjustness or unreasonableness of the existing RTO/ISO tariffs. In addition, the extensive comments submitted by the RTOs/ISOs do not point to any past or planned generator retirements that may be a threat to grid resilience.²⁴ We also disagree

Docket Nos. RM18-1-000 and AD18-7-000

with assertions that an adequate record exists through the Commission's price formation efforts to support the Proposed Rule's action regarding bulk power system resilience.²⁵

16. Turning to the second prong of the section 206 analysis, we note that the Proposed Rule would allow all eligible resources to receive a cost-of-service rate regardless of need or cost to the system.²⁶ The record, however, does not demonstrate that such an outcome would be just and reasonable.²⁷ It also has not been shown that the remedy in the Proposed Rule would not be unduly discriminatory or preferential.²⁸ For example, the Proposed Rule's on-site 90-day fuel supply requirement would appear to permit only

²⁵ The goals of the price formation proceeding center largely on facilitating competition and ensuring that market prices reflect the marginal cost of production so that prices accurately reflect system conditions and operational constraints. *See Price Formation in Energy and Ancillary Services Markets Operated by Regional Transmission Organizations and Independent System Operators*, Notice Inviting Post-Technical Workshop Comments, Docket No. AD14-14-000, at 1 (Jan. 16, 2015) (Notice Inviting Comments); *Price Formation in Energy and Ancillary Services Markets Operated by Regional Transmission Organizations and Independent System Operators*, Notice, Docket No. AD14-14-000 (June 19, 2014) (Price Formation Notice). Thus, that proceeding does not include even an attempted nexus to bulk power system resilience, whereas in the Proposed Rule and in the proceeding we are newly establishing here, the resilience of the bulk power system is the principal focus. In addition, there is no evidence in other Commission proceedings indicating that any RTO/ISO tariffs are unjust and unreasonable because they do not adequately account for resilience.

²⁶ As noted above, the Commission typically has approved as just and reasonable cost-of-service rates through out-of-market arrangements in very limited circumstances and when there is a demonstrated reliability need. *See* note 14, *supra*.

²⁷ For example, the Proposed Rule proposes that RTOs/ISOs pay a cost-of-service rate to a resource that has a 90-day fuel supply on site to enable it to operate during an emergency, extreme weather conditions, or a natural or man-made disaster. However, neither the Proposed Rule nor the record demonstrate why the existence of an on-site 90-day fuel supply is a reasonable basis to find that rate to be just and reasonable and not unduly discriminatory or preferential. In addition, the Proposed Rule does not address the concern that an eligible resource located in a constrained area may not assist with the resilience of the bulk power system to warrant that rate.

²⁸ To be clear, notwithstanding our ruling under section 206 with regard to the Proposed Rule, if an RTO/ISO were to identify a specific threat to the resilience of its system, we would promptly consider an appropriate proposal from the RTO/ISO to address the issue.

certain resources to be eligible for the rate, thereby excluding other resources that may have resilience attributes.

C. Initiating a New Proceeding and Establishing Additional Procedures on Resilience

17. Even though we are terminating Docket No. RM18-1-000, the Commission concluded that it must remain vigilant with respect to resilience challenges. Although the Proposed Rule failed to satisfy the fundamental legal requirements of section 206 of the FPA, the Proposed Rule and the record developed to date have shed additional light on resilience more generally and on the need for further examination by the Commission and market participants of the risks that the bulk power system faces and possible ways to address those risks in the changing electric markets. As the DOE Grid Study documented, we have seen a variety of economic, environmental, and policy drivers that are changing the way electricity is procured and used.²⁹ These changes present new opportunities and challenges regarding the reliability, affordability, and environmental profile of each region's electric system. These changes may impact the resilience of the bulk power system. As we navigate these changes, the Commission's markets, transmission planning rules, and reliability standards should evolve as needed to address the bulk power system's continued reliability and resilience.³⁰

18. Therefore, we are initiating a new proceeding, Docket No. AD18-7-000, to take additional steps to explore resilience issues in the RTOs/ISOs. The goal of this proceeding is: (1) to develop a common understanding among the Commission, industry, and others of what resilience of the bulk power system means and requires; (2) to understand how each RTO and ISO assesses resilience in its geographic footprint; and (3) to use this information to evaluate whether additional Commission action regarding resilience is appropriate at this time. This examination of the resilience of the bulk power system will be a priority of the Commission. Therefore, as described below, we direct each RTO and ISO to submit specific information regarding the resilience of its respective region within 60 days.

²⁹ *Staff Report to the Secretary on Electricity Markets and Reliability*, United States Department of Energy (Aug. 2017), available at https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf.

³⁰ On December 14, 2017, NERC issued its 2017 Long-term Reliability Assessment. That assessment reinforces the continuing need for the Commission to be vigilant and to make the resilience of the bulk power system a priority of the Commission.

19. We recognize that the RTOs/ISOs are well-suited to understand the needs of their respective regions and initially assess how to address resilience given their individual geographic needs. Although the Proposed Rule focuses on one possible aspect of grid resilience – secure onsite fuel – we conclude that a proper evaluation of grid resilience should not be limited to that single issue, and should instead encompass a broader consideration of resilience issues, including wholesale electric market rules, planning and coordination, and NERC standards. Indeed, the efforts of RTOs and ISOs on grid resilience encompass a range of activities, including wholesale electric market design, transmission planning, mandatory reliability standards, emergency action plan development, inventory management, and routine system maintenance. However, many of these activities are not unique to RTOs/ISOs and are performed by transmission providers in areas that do not have centralized wholesale electricity markets. Similarly, NERC and the regional entities tasked with implementation of mandatory reliability standards have a critical role to play in this area. Although hearing from the RTOs/ISOs on this topic is an appropriate place to begin, we will provide interested entities an opportunity to submit reply comments on the RTO/ISO submissions within 30 days of the due date of those submissions.³¹

20. We anticipate that the RTO/ISO submissions will explain how they currently address resilience of the bulk power system within their footprints, and will highlight any specific or unique resilience challenges faced by the regions. The submissions also will give the RTOs/ISOs the opportunity to discuss potential paths forward for addressing any identified gaps or exposure on the resilience of the bulk power system.

1. A Common Understanding of Resilience

21. In order to appropriately study the resilience of the bulk power system in the RTO/ISO regions, we think it is appropriate to first achieve a common understanding of what resilience is in the context of the bulk power system.

³¹ Our focus on the RTOs/ISOs should not be understood to mean that we believe that those systems are less resilient than non-RTO/ISO regions. Rather, we conclude that a targeted proceeding focused on those regions is a prudent next step in our consideration of resilience of the bulk power system. We also note that the concept of resilience necessarily involves issues, topics, and questions that extend beyond the Commission's jurisdiction, such as distribution system reliability and modernization. The Commission encourages RTOs/ISOs and other interested entities to engage with state regulators and other stakeholders through Regional State Committees or other venues to address resilience at the distribution level.

22. According to comments on the Proposed Rule, there seems to be a general consensus that grid reliability and grid resilience are related but separate concepts, with the elements of grid reliability being better understood and defined. It also is evident that there is currently no uniform definition of resilience used across the electric industry. For example, the Proposed Rule states that certain natural and man-made disasters threaten the resilience of the grid, but does not set forth a clear definition for resilience. Commenters have cited various definitions of resilience, including from the National Infrastructure Advisory Council,³² the National Academy of Sciences,³³ Argonne National Laboratory,³⁴ PJM,³⁵ and Presidential Policy Directive 21.³⁶ The Commission notes that commenters generally defined resilience similarly (i.e., as the ability of the bulk power system to withstand or recover from disruptive events).³⁷

23. To help guide consideration of issues related to resilience of the bulk power system, the Commission understands resilience to mean:

³² National Infrastructure Advisory Council, *A Framework for Establishing Critical Infrastructure Resilience Goals: Final Report and Recommendations by the Council* at 15 (Oct. 2010).

³³ National Academy of Sciences, *Enhancing the Resilience of the Nation's Electricity System*, Washington, DC: National Academies Press (Sept. 2017), available at <https://www.nap.edu/catalog/24836/enhancing-the-resilience-of-the-nations-electricity-system>.

³⁴ Department of Energy, Argonne National Laboratory, *Front-Line Resilience Perspectives: The Electric Grid*, Executive Summary at xiii (Nov. 2016), available at <https://energy.gov/sites/prod/files/2017/01/f34/Front-Line%20Resilience%20Perspectives%20The%20Electric%20Grid.pdf>.

³⁵ PJM Interconnection, L.L.C., *PJM's Evolving Resource Mix and System Reliability* n.16 (March 30, 2017), available at <http://www.pjm.com/~media/library/reports-notice/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx>.

³⁶ Michael Moore, Independent Consultant, Comments at 2; Nuclear Energy Institute Comments at 19 (citing Nat'l Archives, Archived Obama White House Website, Presidential Policy Directive 21: Critical Infrastructure Security and Resilience (PPD-21) (Feb. 12, 2013)).

³⁷ See, e.g., Comments of Utility Workers Union of America, AFL-CIO (UWUA) at 5-6 (citing *PJM's Evolving Resource Mix and System Reliability*); FirstEnergy Initial Comments at 17.

The ability to withstand and reduce the magnitude and/or duration of disruptive events, which includes the capability to anticipate, absorb, adapt to, and/or rapidly recover from such an event.³⁸

We seek comment from the RTOs and ISOs on our understanding of resilience as described above. We also ask for comments on whether any of the terms used above require further elaboration to ensure a common understanding (e.g., identification of the particular types of disruptive events).

24. Resilience could encompass a range of attributes, characteristics, and services that allow the grid to withstand, adapt to, and recover from both naturally occurring and man-made disruptive events. At the most basic level, ensuring resilience requires that we both (1) determine which risks to the grid we are going to protect against, and (2) identify the steps, if any, needed to ensure those risks are addressed.

2. How RTOs/ISOs Assess Threats to Resilience

25. Next, the Commission seeks comment on how each RTO/ISO currently evaluates the resilience of its system. The Commission recognizes regional differences among the RTOs/ISOs, and appreciates that those differences likely impact how each RTO/ISO approaches resilience in its region. The Commission directs the RTOs/ISOs to address the following questions on this issue and, as needed, to highlight any unique resilience challenges that exist in their respective regions.³⁹

(a) What are the primary risks to resilience in your region from both naturally occurring and man-made threats? How do you identify them? Are they short-, mid-, or long-term challenges?

(b) How do you assess the impact and likelihood of resilience risks?

(c) Please explain how you identify and plan for risks associated with high-impact, low-frequency events (e.g., physical and cyber attacks, accidents, extended fuel supply disruptions, or extreme weather events). Please discuss the challenges you face in trying to assess the impact and likelihood of high-impact, low-frequency risks. In addition, please describe what additional information, if any, would be helpful in assessing the impact and likelihood of such risks.

³⁸ Generally based on the National Infrastructure Advisory Council's *Critical Infrastructure Resilience Final Report and Recommendations* at 8 (Sept. 8, 2009).

³⁹ The RTOs/ISOs should not include Critical Energy/Electric Infrastructure Information (CEII) in their submissions.

(d) Should each RTO/ISO be required to identify resilience needs by assessing its portfolio of resources against contingencies that could result in the loss or unavailability of key infrastructure and systems? For example, should RTOs/ISOs identify as a resilience threat the potential for multiple outages that are correlated with each other, such as if a group of generators share a common mode of failure (e.g., a correlated generator outage event, such as a wide-scale disruption to fuel supply that could result in outages of a greater number of generating facilities)? The RTOs/ISOs should also discuss resilience threats other than through a correlated outage approach. Do RTOs/ISOs currently consider these types of possibilities, and if so, how is this information used?

(e) Identify any studies that have been conducted, are currently in progress, or are planned to be performed in the future to identify the ability of the bulk power system to withstand a high-impact, low-frequency event (e.g., physical and cyber-attacks, accidents, extended fuel supply disruptions, or extreme weather events). Please describe whether any such studies are conducted as part of a periodic review process or conducted on an as-needed basis.⁴⁰

(f) In these studies, what specific events and contingencies are selected, modeled, and assessed? How are these events and contingencies selected?

(g) What criteria (e.g., load loss (MW)), duration of load loss, vulnerability of generator outages, duration of generator outages, etc.) are used in these studies to determine if the bulk power system will reasonably be able to withstand a high-impact, low-frequency event? Are the studies based on probabilistic analyses or deterministic analyses?

(h) Do any studies that you have conducted indicate whether the bulk power system is able to reasonably withstand a high-impact, low frequency event? If so, please describe any actions you have taken or are planning as mitigation, and whether additional actions are needed.

(i) How do you determine whether the threats from severe disturbances, such as those from low probability, high impact events require mitigation? Please describe any approaches or criteria you currently use or otherwise believe are useful in determining whether certain threats require mitigation.

⁴⁰ The Commission is not directing that these studies be included in the RTO/ISO submissions filed in response to this order. Instead, the RTOs/ISOs are required to identify and describe such studies in their submissions.

- (j) How do you evaluate whether further steps are needed to ensure that the system is capable of withstanding or reducing the magnitude of these high-impact, low frequency events?
- (k) What attributes of the bulk power system contribute to resilience? How do you evaluate whether specific components of the bulk power system contribute to system resilience? What component-level characteristic, such as useful life or emergency ratings, support resilience at the system level?
- (l) If applicable, how do you determine the quantity and type of bulk power system physical asset attributes needed to support resilience? Please include, if applicable, what engineering and design requirements, and equipment standards you currently have in place to support resilience? Are those engineering and design requirements designed to address high-impact, low-frequency events? Do these requirements change by location or other factors?
- (m) To what extent do you consider whether specific challenges to resilience, such as extreme weather, drought, and physical or cyber threats, affect various generation technologies differently? If applicable, please explain how the different generation technologies used in your system perform in the face of these challenges.
- (n) To what extent are the challenges to the resilience of the bulk power system associated with the transmission system or distribution systems, rather than electric generation, and what could be done to further protect the transmission system from these challenges?
- (o) Over what time horizon should the resilience assessments discussed above be conducted, and how frequently should RTOs/ISOs conduct such an analysis? How could these studies inform planning or operations?
- (p) How do you coordinate with other RTOs/ISOs, Planning Coordinators, and other relevant stakeholders to identify potential resilience threats and mitigation needs?
- (q) Are there obstacles to obtaining the information necessary to assess threats to resilience? Is there a role for the Commission in addressing those obstacles?
- (r) Have you performed after-the-fact analyses of any high-impact, low-frequency events experienced in the past on your system? If so, please describe any recommendations in your analyses and whether they have or have not been implemented.

- (s) Please provide any other information that you believe the Commission would find helpful in its evaluation of the resilience of the RTO/ISO systems.

3. **How RTOs/ISOs Mitigate Threats to Resilience**

26. Once an RTO/ISO identifies a particular need or threat to resilience, there could be various ways to mitigate such risk. For example, RTO and ISO resource adequacy programs require reserve margins necessary to ensure adequate generation capacity to meet peak load conditions throughout the year. Further, RTO and ISO day-ahead and real-time markets generally secure and operate the transmission system assuming the loss of the largest vulnerable element at any given time. RTOs/ISOs may take additional actions to address concerns beyond the largest vulnerable element, such as procuring additional operating reserves. In 2014, for example, PJM implemented shortage pricing for operating reserves procured to respond to risks that could reasonably materialize and for which PJM's normal reserve procurement processes would not otherwise account.⁴¹ Further, all RTOs/ISOs have a residual unit commitment process to address regionally identified reliability considerations.⁴² Finally, resources that provide ancillary services, such as those with black-start capability, help ensure recovery from power-loss events without the need for auxiliary power from the grid.

27. In the submissions, we seek comment on how RTOs/ISOs evaluate options to mitigate any risks to grid resilience. We direct the RTOs/ISOs to answer the following questions on this topic:

- (a) Describe any existing operational policies or procedures you have in place to address specific identified threats to bulk power system resilience within your region. Identify each resilience threat (e.g., the potential for correlated generator outage events) and any operational policies and procedures to address the threat. Describe how these policies or procedures were developed in order to ensure their effectiveness in mitigating the identified risks and also describe any historical circumstances where you implemented these policies or procedures.
- (b) How do existing market-based mechanisms (e.g., capacity markets, scarcity pricing, or ancillary services) currently address these risks and support resilience?

⁴¹ *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,017 (2014).

⁴² *Staff Analysis of Operator-Initiated Commitments in RTO and ISO Markets*, Docket No. AD14-14-000 at 10-14 (Dec. 2014), available at <https://www.ferc.gov/legal/staff-reports/2014/AD14-14-operator-actions.pdf>.

(c) Are there other generation or transmission services that support resilience? If yes, please describe the service, how it supports resilience, and how it is procured.

(d) How do existing operating procedures, reliability standards (e.g., N-1 NERC TPL contingencies), and RTO/ISO planning processes (e.g., resource adequacy programs or regional transmission planning) currently consider and address resilience?

(e) Are there any market-based constructs, operating procedures, NERC reliability standards, or planning processes that should be modified to better address resilience? If so, please describe the potential modifications.

D. Conclusion

28. Promoting the resilience of the bulk power system is an important issue for the Commission. Each RTO/ISO should take a proactive stance on addressing and ensuring resilience. We are encouraged by efforts underway in PJM⁴³ and ISO-NE⁴⁴ to better understand vulnerabilities in their systems, and support similar efforts in other regions where analyses of potential resilience issues could be helpful. We also are encouraged by the ongoing work in MISO⁴⁵ to develop a long-term plan to address changing system needs in light of an evolving resource mix. At the heart of each of these initiatives is collaboration between RTOs/ISOs and their stakeholders, and we look forward to receiving stakeholder input on the submissions. As noted above, the topic of the new proceeding - resilience of the bulk power system - will remain a priority of the Commission and we expect to review the additional material and promptly decide whether additional Commission action on this issue is warranted.

⁴³ See *PJM's Evolving Resource Mix and System Reliability* *supra* note 35.

⁴⁴ See ISO-NE Initial Comments at 7 (“[T]he ISO has an upcoming process planned to quantify risks related to fuel security.”).

⁴⁵ See MISO Initial Comments at 8 (“MISO values discrete reliability attributes for generation resources through proven market-based mechanisms and continues to work with stakeholders on further market-based reliability improvements. Through its Market Roadmap, MISO is exploring several such initiatives...”).

The Commission orders:

(A) The RTOs/ISOs are hereby directed to provide responses to the Commission, as discussed in the body of this order, within 60 days of the date of this order. Interested entities may submit reply comments within 30 days of the due date of the RTO/ISO submissions.

(B) The proceeding in Docket No. RM18-1-000 is hereby terminated, as discussed in the body of this order.

By the Commission. Commissioners LaFleur, Chatterjee, and Glick are concurring with separate statements attached.

(S E A L)

Kimberly D. Bose,
Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing

Docket Nos. RM18-1-000

Grid Resilience in Regional Transmission Organizations
and Independent System Operators

AD18-7-000

(Issued January 8, 2018)

LaFLEUR, Commissioner *concurring*:

Since I have been at the Commission, the reliability of the nation's electric system in serving customers has been my top priority. In my view, resilience — the ability to withstand or recover from disruptive events and keep serving customers — is unquestionably an element of reliability. Indeed, I believe it has already informed much of the Commission's work on both market rules and reliability standards.¹ As part of our continued work in this area, I support the Commission's action today to start a focused proceeding to explore how the RTOs/ISOs address the resilience of the grid in their respective regions, and whether there are additional steps the Commission should take to support resilience.

I also strongly support the decision not to adopt the rule proposed by the Secretary of Energy.² As explained below, as well as in Commissioner Glick's separate statement, I do not think the record demonstrates the need for the Proposed Rule to support resilience. Further, even had a resilience issue been demonstrated, I have serious concerns about the nature of the proposed remedy, which would address the issue not through market rules but through out-of-market payments to certain designated resources.

I write separately to expand on the larger context surrounding the issues in this docket, and how I believe the Commission should approach them going forward.

While the challenge of providing reliable energy is constant, the nature of the challenge has necessarily changed as the resources, infrastructure, and commercial and regulatory structures relied upon to meet that challenge have evolved. Even before the harnessing of electricity, the history of energy in this country has been one of continual

¹ See *Grid Reliability and Resilience Pricing*, 162 FERC ¶ 61,012, at P 12 (2018).

² Proposed Rule on Grid Reliability and Resilience Pricing, Docket No. RM18-1-000 (2017) (Proposed Rule). The full text of the Proposed Rule can be found at: <https://energy.gov/downloads/notice-proposed-rulemaking-grid-resiliency-pricing-rule>.

change and progress. We have moved from reliance on wood and local waterworks in the 19th century to the development of coal-fired steam generators and large-scale hydro in the first half of the 20th century. The mid-20th century saw the commercialization of nuclear generation, followed later in the century by the large-scale introduction of combined cycle gas generation and early-stage non-hydro renewables.

None of these changes in where the nation gets its energy were driven by this Commission or its predecessors. However, the Commission has played a role in adapting to technological change, ensuring that rates remained just and reasonable and customers were served reliably through successive generations and technological changes. Thus, in the late 20th century, responding to customer demands for access to new technologies and new generation choices, FERC oversaw the introduction of competitive wholesale power markets, which have continued to spread over the past 20 years to cover more than two-thirds of the nation's population. I am a strong supporter of competitive markets, which benefit customers by reducing costs, improving efficiency and innovation, and strengthening reliability by deploying resources over a broader footprint.

In the 21st century, against the backdrop of wholesale markets, the pace of technological change in energy has accelerated, resulting in a rapid transformation of the nation's resource mix. This has been driven by (1) the growth in the availability and affordability of domestic natural gas and its increased use for electric generation, (2) the rapid development and deployment of wind, solar, storage, and demand-side technologies, both central and distributed, and (3) a changing understanding of the environmental consequences of energy use, especially climate change, driving state and federal policy and customer choices.

With these new technologies have come changes in the location and operation of energy resources, their cost patterns, and the way grid operators plan their systems and deploy resources to keep the lights on. As with all transitions, there have been market winners and losers as new technologies have brought competitive pressures to bear on existing resources. Resource turnover is a natural consequence of markets, and the reduced prices that result from greater competition are a benefit to customers, not a problem to solve, unless reliability is compromised. Keeping up with these changes by ensuring that market tariffs and reliability standards sustain both reliability and just and reasonable rates in a time of changing resources has been a major focus of the Commission, and must continue to be.

As the recent Department of Energy grid study³ and numerous analyses by

³ *Staff Report to the Secretary on Electricity Markets and Reliability*, United States Department of Energy (August 2017), available at <https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20>

NERC⁴ have noted, the transformation of the resource mix to date has been accomplished without compromising reliability.⁵ However, ensuring that this continues to be the case requires continued diligence, and the inquiry we begin in this docket will support that ongoing effort.

Where the Commission has seen evidence of the need for greater system resilience in a changing resource mix, it has acted to ensure that such resilience was provided. It has generally done so by overseeing changes to market design (defining needed resource performance, and using competition to obtain it),⁶ interconnection agreements or other tariffs (requiring that certain essential reliability services be provided),⁷ or mandatory reliability standards.⁸ In each case, the Commission has recognized a customer need,

0Markets%20and%20Reliability 0.pdf.

⁴ *E.g.*, 2017 Long-term Reliability Assessment, North American Electric Reliability Corporation (December 2017), available at http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_12132017_Final.pdf.

⁵ Indeed, as Commissioner Glick correctly notes in his concurrence, new resource additions have in some ways strengthened the resilience of the power system. For example, notwithstanding alleged concerns by some about the loss of fuel diversity, the resource mix in many regions of the country (such as that served by PJM Interconnection, L.L.C.) is more diverse than ever before as new technologies and resources are introduced.

⁶ *E.g.*, *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208 (2015), *reh'g denied*, 155 FERC ¶ 61,157 (2016), *aff'd sub nom. Advanced Energy Mgmt. All. v. FERC*, 860 F.3d 656 (D.C. ⁸ *E.g.*, *Frequency Response and Frequency Bias Setting Reliability Standard*,

Docket No. RM18-1-000, *et al.*

relied upon evidence to define it in a fuel-neutral way, and either allowed the market to transparently price it or established broad requirements to ensure that a needed service is provided. If the record that develops in this docket similarly demonstrates unmet resilience needs, I believe that the Commission should take a comparable approach.

Indeed, this preferred approach highlights one of my key objections to the Proposed Rule, which did not make a factual showing of a defined resilience need or allow a market or standards-based solution to solve that need. Rather, it presumed a resilience need and proposed a far-reaching out-of-market approach to “solve” it. This proposed remedy, which simply designated resources for support rather than determining what services needed to be provided, would be highly damaging to the ability of the market to meet customer needs—including any demonstrated resilience needs—fairly, efficiently, and transparently. In effect, it sought to freeze yesterday’s resources in place indefinitely, rather than adapting resilience to the resources that the market is selecting today or toward which it is trending in the future.

I believe the Commission should continue to focus its efforts not on slowing the transition from the past but on easing the transition to the future. We must continue to guide grid operators in sustaining reliability and resilience within a system that is likely to be cleaner, more dynamic, in some instances more distributed, and deployed by an efficient market for the benefit of customers. In this way, we can help the grid adapt to the transformations of the present, and best position the grid for the unknown future transformations that the history of our industry suggests are inevitable. For these reasons, I respectfully concur.

Cheryl A. LaFleur
Commissioner

Order No. 794, 146 FERC ¶ 61,024 (2014).

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing

Docket Nos. RM18-1-000

Grid Resilience in Regional Transmission
Organizations and Independent System Operators

AD18-7-000

(Issued January 8, 2018)

CHATTERJEE, Commissioner, *concurring*:

I concur in this order with the expectation that it is only the first step in a more systematic effort by the Commission, over both the near and long term, to ensure the resilience of the nation's bulk power system. The success of this effort will require the Commission's continued vigilance and willingness to take, within the bounds of its statutory authority, prompt, proactive, and decisive measures to safeguard resilience.

I applaud Secretary Perry's bold leadership in jump-starting a national conversation on this urgent challenge. Given the importance of the bulk power system to our nation's security, economic stability, and public health and safety, we must ensure its resilience amidst tremendous changes in our generation resource mix. My goal throughout this proceeding has been to ensure that we do not later come to regret failing to ask the difficult questions. I believe that the order we are issuing today is a positive step toward that goal. I look forward to receiving responses to the questions posed to the RTOs/ISOs, and comments from interested entities.

Nevertheless, I must voice my concerns regarding bulk power system resilience in the interim period prior to the conclusion of the proceeding we initiate today. Major regulatory reform efforts often can take several years to complete. But I believe that the record compiled in this proceeding speaks to the prudence of considering, as soon as practicable, whether interim measures may be needed to avoid near-term bulk power system resilience challenges that could result from the rapid, unprecedented changes in our generation resource mix.

The scale and pace of those changes are staggering. Between 2014 and 2015 alone, the U.S. added approximately 15,800 megawatts (MW) of natural gas, 13,000 MW of wind, 6,200 MW of utility scale solar photovoltaic, and 3,600 MW of distributed solar photovoltaic generating capacity.¹ Meanwhile, nearly 42,000 MW of synchronous

¹ U.S. Energy Information Administration, *Electricity*, available at

generating capacity (e.g., coal, nuclear, and natural gas) retired between 2011 and 2014, with an additional seven nuclear units (representing 10,500 MW of nameplate capacity) planning retirement by 2025.² Commenters express an expectation that those trends will continue in the years ahead, with many nuclear and coal units particularly at risk of economic retirement despite their significant contribution to bulk power system resilience.³

The changing generation resource mix underscores the need to consider whether near-term measures are warranted notwithstanding the actions the Commission has taken in recent years that are outlined in today's order. Specifically, current RTO/ISO market design mechanisms are intended to incent generation resource owners to manage the fuel supply risks they can control -- not the spectrum of fuel supply risks beyond their control.⁴ The record clearly suggests that the latter class of risks are increasingly significant due to shifts in the generation mix and the fast-evolving national security threat environment.⁵ Neither current RTO/ISO tariffs nor the NERC Reliability

<https://www.eia.gov/electricity/annual/backissues.html>.

² *Id.*; NERC Comments, Docket No. RM18-1-000, at 4-5 (filed Oct. 23, 2017).

³ *See, e.g.*, Reply Comments of Peabody Energy Corporation, Docket No. RM18-1-000, at 10 (filed Nov. 7, 2017); Reply Comments of the Nuclear Energy Institute, Docket No. RM18-1-000, at 6-11 (filed Nov. 7, 2017); *see also* NERC Comments at 4-6 (noting the resilience contributions of coal and nuclear generation's dependable capacity, inertia and voltage control services, and fuel security).

⁴ The Commission has approved market constructs providing financial incentives for resource owners to procure firm fuel arrangements either through firm pipeline capacity or dual fuel capability. *See, e.g., ISO New England Inc.*, 147 FERC ¶ 61,172, at P 36 (2014) (endorsing pay-for-performance program); *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208, at P 22 (2015) (approving PJM's capacity performance construct). *See also Wholesale Competition in Regions with Organized Electric Markets*, Order No. 719, FERC Stats. & Regs. ¶ 31,281 (2008), *order on reh'g*, Order No. 719-A, FERC Stats. & Regs. ¶ 31,292 (2009), *order on reh'g*, Order No. 719-B, 129 FERC ¶ 61,252 (2009) (requiring RTO/ISO scarcity pricing that incents firm fuel arrangements). But generation resource owners relying on fuels delivered "just-in-time" from offsite supplies are not capable of managing risks to (1) the infrastructure that transports these fuels (e.g., pipelines); and (2) the infrastructure that supplies these fuels (e.g., natural gas wellheads).

⁵ *See, e.g.*, Exelon Corporation Comments, Docket No. RM18-1-000, Stockton Test. at 5-6, 13 (filed Oct. 23, 2017); *see also* Congressional Research Service, Pipeline Cybersecurity: Federal Policy (Apr. 19, 2016).

Standards require RTOs/ISOs to assess these fuel supply risks or other significant resilience risks and mitigate their potentially significant impact on the bulk-power system. This suggests that existing RTO/ISO tariffs may be unjust and unreasonable insofar as they may not adequately compensate resources for their contributions to bulk power system resilience.

Consequently, I believe it would have been prudent, in addition to establishing the proceeding in Docket No. AD18-7-000, for the Commission to issue an order to show cause pursuant to section 206 of the Federal Power Act directing each RTO/ISO to either (1) submit tariff revisions to provide interim compensation for existing generation resources that may provide necessary resilience attributes and are at risk of retirement before the conclusion of the proceeding established today or (2) show cause why it should not be required to do so.

Given the nascence of the Commission's effort to more systematically examine resilience, I believe that it would have been appropriate to provide the RTOs/ISOs with latitude in determining the implementation of any interim measures needed. In particular, I would have allowed RTOs/ISOs to define which resources provide necessary resilience attributes and are at risk of retirement before the conclusion of the proceeding initiated in Docket No. AD18-7-000. Because of their detailed knowledge of their own systems, the RTOs/ISOs are well-positioned to understand the specific resilience risks in their footprints, to identify the resilience attributes that would most effectively mitigate those risks, and to tailor appropriate tariff mechanisms to meet their needs. Such an approach would have struck an appropriate balance to remedy any potentially unjust and unreasonable compensation practices while minimizing the impact on consumers and markets as the Commission considered longer-term reforms. In addition, such an approach also would have reduced the probability of retirement of resources which subsequently were determined to be the most cost-effective means of providing necessary resilience attributes.

The Commission previously has stressed its preference for market-based mechanisms as a means to ensure just and reasonable rates in jurisdictional organized markets. I share this preference for market-based solutions and would have urged RTOs/ISOs to identify market mechanisms to address these concerns. However, the Commission also has recognized that interim, out-of-market solutions might be appropriate in certain circumstances.⁶ Accordingly, I would have required that tariff

⁶ See *ISO New England Inc.*, 144 FERC ¶ 61,204 at P 21 (accepting ISO-NE tariff provisions to provide for short-term out-of-market payments to resources to ensure reliability in the 2013-2014 winter period); see also *N.Y. Indep. Sys. Operator, Inc.*, 150 FERC ¶ 61,116 at P 2 ("While the Commission has repeatedly stated that our jurisdictional markets should utilize market mechanisms to ensure that the resulting rates are just and reasonable, the Commission has also recognized that short-term remedies,

revisions proposed by the RTOs/ISOs endeavor to minimize the effect on the wholesale markets (in particular the energy markets). To this end, I would have stated an expectation that each RTO/ISO develop any out-of-market mechanisms only as a last resort.

As I explained consistently over the past few months, it was my goal that any effort with respect to an interim step would be legally defensible, would not distort markets, and would address the issues Secretary Perry raised. I believe an order as discussed above would have met that goal. And while I would have preferred such an order, I am nevertheless encouraged by today's order, which represents a positive step forward in addressing these critical issues.

For these reasons, I respectfully concur.

Neil Chatterjee, Commissioner

such as RMR agreements, may be appropriate in certain circumstances to address an immediate problem at hand.”).

FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing

Docket Nos. RM18-1-000

Grid Resilience in Regional Transmission Organizations
and Independent System Operators

AD18-7-000

(Issued January 8, 2018)

GLICK, Commissioner, *concurring*:

I fully support the Commission's action today to initiate a new proceeding examining the resilience of the bulk power system. I commend the Chairman for his leadership in guiding the Commission as it addresses this difficult, but important issue. I also support the Commission's decision to terminate Docket No. RM18-1-000, which addressed the Proposed Rule on Grid Reliability and Resilience Pricing (Proposed Rule) submitted to the Commission by the Secretary of the Department of Energy. The Proposed Rule had little, if anything, to do with resilience, and was instead aimed at subsidizing certain uncompetitive electric generation technologies. As my colleague Commissioner LaFleur explains, it is important to consider the resilience of the bulk power system in a larger context that accounts for the changing electricity industry rather than seeking to preserve the *status quo*.

I write separately to explain my rationale for concluding that the Proposed Rule is inconsistent with the Commission's statutory responsibilities. Although the Department had the authority under Section 403 of the Department of Energy Organization Act¹ to submit the Proposed Rule, the Commission could adopt the proposal only if it met the requirements of section 206² of the Federal Power Act. The Proposed Rule fails to meet that standard.

As today's order recognizes, the record in this proceeding—as well as the other proceedings referenced by the Department³—does not support the Department's

¹ 42 U.S.C. § 7173 (2012).

² 16 U.S.C. § 824e (2012).

³ *Grid Resiliency Pricing Rule*, 82 Fed. Reg. 46,940, 46,944-45 (2017).

contention that the tariffs of certain RTOs and ISOs are unjust and unreasonable or unduly discriminatory or preferential. The Department's own staff Grid Study concluded that changes in the generation mix, including the retirement of coal and nuclear generators, have not diminished the grid's reliability or otherwise posed a significant and immediate threat to the resilience of the electric grid.⁴ To the contrary, the addition of a diverse array of generation resources, including natural gas, solar, wind, and geothermal, as well as maturing technologies, such as energy storage, distributed generation, and demand response, have in many respects contributed to the resilience of the bulk power system. The record in this proceeding does not demonstrate any need for the Commission to interfere with the continued evolution of the bulk power system.

Nor does the record support the Department's proposed remedy: A multi-billion dollar bailout targeted at coal and nuclear generating facilities.⁵ There is no evidence in the record to suggest that temporarily delaying the retirement of uncompetitive coal and nuclear generators would meaningfully improve the resilience of the grid. Rather, the record demonstrates that, if a threat to grid resilience exists, the threat lies mostly with the transmission and distribution systems, where virtually all significant disruptions occur.⁶ It is, after all, those systems that have faced the most significant challenges during extreme weather events.

⁴ *Staff Report to the Secretary on Electricity Markets and Reliability*, United States Department of Energy at 63, 100 (Aug. 2017), available at https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf (Department of Energy Grid Study).

⁵ See, e.g., PJM Independent Market Monitor Comments at 5 (estimating that the Proposed Rule would have cost consumers in PJM an additional \$30 billion in 2015 and \$32 billion in 2016); Joint Industry Commenters, Attachment A at 2, 32 (Battle Group report estimating that the Proposed Rule would result in \$3.7 billion to \$11.2 billion in out-of-market payments annually in PJM, ISO-NE, and NYISO); see also Electricity Consumers Resource Council Reply Comments at 11-15 (summarizing cost estimates submitted to the record, all of which estimated that the Proposed Rule would cost consumers billions of dollars).

⁶ See Joint Industry Commenters at 3 (citing a Rhodium Group study showing that "0.00007% of customer-hours lost to outage were caused by fuel supply emergencies between 2012-2016," a period that included the 2014 Polar Vortex); Department of Energy, Quadrennial Energy Review, Second Installment at 4-2 (2017) available at <https://energy.gov/sites/prod/files/2017/02/f34/Chapter%20IV--Ensuring%20Electricity%20System%20Reliability%2C%20Security%2C%20and%20Resilience.pdf> ("Electricity outages disproportionately stem from disruptions on the

In addition, coal and nuclear generators face resilience challenges of their own. As has been well-documented, many coal and nuclear plants with significant on-site fuel supplies have failed to function during extreme weather events because those fuel supplies froze, flooded, or were otherwise unavailable.⁷ In fact, initial reports indicate that coal-fired facilities accounted for nearly half of all forced outages in PJM during last week's period of extreme temperatures. Similarly, during the same period, the Pilgrim Nuclear Power Station was manually removed from service complicating efforts to serve load within ISO-NE. And, even when fully operational, many coal and nuclear generators are incapable of providing all the NERC-defined essential reliability services.⁸ It is perhaps for that reason that the Department's Grid Study recommended pursuing "wholesale market and product designs that recognize and complement resource diversity by compensating providers for the value of [essential reliability services] on a *technology-neutral* basis."⁹

Finally, I am sympathetic to the plight of coal miners, who have been disproportionately affected as coal's share of the generation mix has declined. These men and women went to work every day, at considerable risk to their health and safety, to supply coal when it was needed most. Many of those same considerations extend to individuals employed at recently or soon-to-be decommissioned nuclear power plants.

distribution system (over 90 percent of electric power interruptions), both in terms of the duration and frequency of outages. . . . Damage to the transmission system, while infrequent, can result in more widespread major power outages that affect large numbers of customers with significant economic consequences.").

⁷ For example, more than 15 gigawatts of coal and nuclear capacity were forced offline during the 2014 Polar Vortex as temperatures fell below those plants' operating thresholds. Electric Power Supply Association Comments, Attachment A at 17. Similarly, nuclear facilities lying in the path of hurricanes are routinely taken offline as a precaution and not returned to service until after the threat has passed.

⁸ Department of Energy Grid Study at 71-72 (citing Joseph H. Eto *et al.*, Lawrence Berkeley National Laboratory, Use of Frequency Response Metrics to Assess the Planning and Operating Requirements for Reliable Integration of Variable Renewable Generation (2010), *available at* <https://www.ferc.gov/industries/electric/indus-act/reliability/frequencyresponsemetrics-report.pdf>). The cited report explains that when nuclear plants and large coal plants are operated at maximum output, as they frequently are, they will be incapable of providing primary frequency response, one of the essential reliability services identified by NERC.

⁹ Department of Energy Grid Study at 100 (emphasis added).

We have a history in this country of helping those who, through no fault of their own, have been adversely affected by technological and market change. But that is the responsibility of Congress and the state legislatures. It is not a role that the Federal Power Act provides to the Commission.

* * *

I agree with the Commission's decision to initiate a comprehensive examination of the resilience of the bulk power system in the form of today's order. Utilities face diverse challenges, including the threat of cyber or physical attacks and natural disasters, such as the extreme weather events that are occurring more frequently as a result of climate change. It is not without irony that the Department's Proposed Rule would exacerbate the intensity and frequency of these extreme weather events by helping to forestall the retirement of coal-fired generators, which emit significant quantities of greenhouse gases that contribute to anthropogenic climate change.¹⁰ I encourage the RTOs and ISOs to use this opportunity to undertake a serious review of these challenges along with other concerns regarding the resilience of their system.

In addition, RTOs and ISOs should consider how best to mitigate these challenges *within* their markets and *without* prejudging what technology or fuel-type provides the best solution. In particular, I urge them to consider carefully the Commission's questions regarding how different generation technologies—both traditional technologies and newer, less widespread technologies—perform when faced with extreme weather, including droughts. I also believe that it is important to consider the advantages that newer technologies, such as distributed energy resources, energy storage, and micro-grids, may offer in addressing resilience challenges to the bulk power system. Similarly, I urge the RTOs and ISOs to consider carefully the Commission's question regarding the extent to which resilience challenges are associated with the transmission system or distribution systems, rather than electric generation. As I noted, the transmission and distribution systems have historically been the principal cause of virtually all significant disruptions and are, therefore, an important element of any examination into the resilience of the bulk power system. Finally, I agree with the Commission that is important to explore the concept of correlated outages and, in particular, the extent to

¹⁰ A research paper submitted to the record by Resources for the Future estimates that adopting the Proposed Rule would result in an additional 53 million tons of CO₂ emissions by 2045. Resources for the Future also estimates that the Proposed Rule would cause 27,000 premature deaths by 2045 by increasing the emissions of other air pollutants (NO_x and SO_x). See Daniel Shawhan and Paul Picciano, Resources for the Future, Costs and Benefits of Saving Unprofitable Generators: A Simulation Case Study for US Coal and Nuclear Power Plants at 11 (Nov. 2017).

which the cyber and physical security of natural gas pipelines threatens the resilience of the bulk power system and how the Commission should address this issue.

In conclusion, I am confident that the Commission will approach this new examination into the resilience of the bulk power system in the same manner it considers all other matters—with a non-partisan perspective and with a view solely on what the facts provide and the law requires. If the RTOs and ISOs demonstrate that the resilience of the bulk power system is threatened we should act. If not, we should move on.

For these reasons, I respectfully concur.

Richard Glick
Commissioner

ENERGYWIRE

THE TRANSFORMATION OF THE ENERGY SECTOR

WHITE HOUSE

Presidential limits: Trump can't come through for coal

Peter Behr and Saqib Rahim, E&E News reporters

Published: Wednesday, August 23, 2017

"Tell Cohn to do whatever these two want him to do."

This secondhand account of President Trump's directions on rescuing Ohio power utility FirstEnergy Corp. and its coal supplier, Murray Energy Corp., sounded like a boss to king. As president, it didn't work.

In an Aug. 4 letter obtained by the Associated Press, Robert Murray, chairman and CEO of Murray Energy, described a conversation with the president in which Trump ordered an aide to see that Gary Cohn, director of the White House National Economic Council, gave Murray and Charles Jones, CEO of FirstEnergy "whatever" they were asking for.

As the letter spells out in detail, unchallenged by the White House or Murray's company, Murray pleaded for a federal rescue for the Ohio utility's FirstEnergy Solutions merchant coal-fired generating plants, which stood "on the verge of bankruptcy."

"Their bankruptcy will force Murray Energy Corp. into immediate bankruptcy, promptly terminating our 6,500 coal mining jobs," with devastating losses to those coal communities, Murray said. "This would be a disaster for President Trump and for our coal miners and employees" (*E&E News PM*, Aug. 22).

But Trump could not deliver for the men he called "my coal miners," nor for Murray, one of his most outspoken political supporters. Murray was not one of the corporate CEOs who broke with Trump over the president's equivocal comments on the violence in Charlottesville, Va. Instead, he was an ally who said he was "praying and pacing the floor" election night, hoping for a Trump victory (*Greenwire*, Feb. 17).

In his letter to Trump White House aide John McEntee III, Murray said he had heard Trump direct Energy Secretary Rick Perry three times to rescue the companies, which sought a federal moratorium on further closings of Ohio coal-fired power plants. Murray quoted Trump saying, "I want this done."

But the only lever available to Perry — an action under Section 202(C) of the Federal Power Act — is restricted to short-term actions in response to emergencies that threaten power grid reliability or power delivery, not the chronic plight of coal plants that cannot compete with turbine generators running on cheap Ohio and Pennsylvania shale gas.

The history of this Power Act provision showed it to be an emergency remedy. Perry had ordered the Grand River Dam Authority in Oklahoma to keep operating a facility in April to provide voltage support for the nearby power grid, until replacement generation was available. It was invoked in 2008 in response to grid damage along the Gulf Coast from Hurricane Ike, in 2005 after Hurricane Rita, in 2003 following a blackout in the Northeast, and in 2000 to deal with the California energy crisis.

DOE spokeswoman Shaylyn Hynes said in a statement to the Associated Press, "We look at the facts of each issue and consider the authorities we have to address them, but with respect to this particular case at this particular time, the White House and the Department of Energy are in agreement that the evidence does not warrant the use of this emergency authority."

Melissa Powers, an associate law professor at Lewis & Clark Law School, said Murray's letter was "self-defeating," considering the help he was asking for.

"A letter that begins with a reference to President Trump telling an agency official to 'do whatever these two [Murray and the FirstEnergy CEO] want him to do' is exactly NOT the letter I would want to rely on in an administrative proceeding," she said. The letter focuses on impacts on the companies, not on grid reliability imperatives, Powers said.

John Moore, director of the Natural Resources Defense Council's Sustainable FERC Project, and NRDC clean energy attorney Miles Farmer commented in a blog that DOE's regulations make clear that the emergency authority is limited to "unexpected inadequate supply of electric energy," such as would be caused by "the unexpected outage of facilities" from events like "weather conditions" or "acts of God."

An emergency order would have had symbolic value at first. But what would be the benefit of ordering coal-fired power plants to keep operating when the administration cannot order utilities to buy their electricity — costing more than competitive power from gas generation?

When Trump ordered help for Murray and the coal industry, he appeared to be “following his instincts,” as he said he always liked to do as a boss.

But Trump this week, speaking about Afghanistan, said he realizes that decisions are different “when you sit behind the desk in the Oval Office. In other words, when you’re president of the United States.”

As he sat behind that same desk, should Trump have been told that Murray’s request couldn’t be met? Was he improperly briefed? Was he briefed and then ignored aides, or did he make promises he knew he couldn’t keep?

Coal CEO Says Bailout No Longer Needed

Murray Energy chief credits pickup in exports to Asia for business revival

By Thomas H. Patten
And Andrew Ross

Coal magnate Robert Murray, after turning his company around, says the Midwest coal industry could be poised for a recovery if it gets a bailout from federal regulators, and he expects his company to thrive whether or not the Trump administration intervenes.

Mr. Murray, chief executive and controlling owner of Murray Energy Corp., said in an interview that turning around his company's growing exports to that region, along with his company's growing exports to that region, have revived his business. Growing Chinese imports, and a recovering global economy, drove up coal prices, offsetting a long-term decline in U.S. demand.

Murray Energy also is competing up sales in India with help from a London-based trading firm that the company helped open in 2013.

"We got the best coal company in the world," he said.

That optimistic outlook makes a strong contrast to what Mr. Murray has said about his business just days ago. Last summer, he told the *Wall Street Journal* that the company's Appalachian mines might close within an emergency timeline for the power-plant fleet at FirstEnergy

Murray Energy CEO Robert Murray, right, had warned of a possible bankruptcy if the Trump administration didn't intervene.

Corp., a major coal-burning customer of Murray Energy. A FirstEnergy subsidiary requested federal intervention last month and the Energy Department is weighing a response.

Mr. Murray says he plans to launch a new subsidiary to make his company the largest privately owned U.S. coal miner. Since 2011, the company

After Donald Trump was elected president, Mr. Murray rejected himself into the center of a national debate about what the Trump administration might do to save the struggling coal industry. He has asked Mr. Trump to declare an emergency order—one designed for times of war and natural disasters—to keep unprofitable coal-fired plants open, saying doing that creates

a national security risk. But Mr. Murray's critics say intervention undermines free competition and domestic markets.

An emergency request in favor of the Energy Department, Kennedy filed by a FirstEnergy subsidiary would benefit many of the plants in Ohio and the surrounding states that rely on Murray coal. It has already received the company's support in

series of acquisitions and by creating a trading house, Jovian Global Commodities Ltd., just as prices started to rebound. Mr. Murray spent much of 2014 and 2015 publicly fighting for more than \$4 billion in debt at Murray and a sister company, and an additional \$2 billion in equity with national, but now he is making them without trouble, he told

the *Journal*.

The country's electricity grid is in the middle of a historic transformation. Rapid technological advancements have made gas-fired and renewable power cheaper, putting demand for older coal-fired competitors at risk. The viability of a number of corporations—and thousands of jobs—are on the line.

Some states have approved help for nuclear power plants, and FirstEnergy has forced a similar decision on the Trump administration. In late March it asked the Energy Department to declare an emergency under a highly used, 43-year-old law to guarantee profits for its nuclear and coal-fired plants and dozens of others across the Midwest and Mid-Atlantic states. Its FirstEnergy Solutions power-generation business, based in PPS, filed for bankruptcy protection two days later.

PPS operates coal-powered plants in Ohio and Pennsylvania with combined capacity some 4,700 megawatts. It was bankruptcy earnings from PPS last year that prompted Mr. Murray to warn last year that Murray Energy too, could go under. He said an PPS chapter 11 would tip Murray Energy into an "imminent bankruptcy," as well.

But Murray Energy hasn't filed for bankruptcy protection and doesn't need to, Mr. Murray told the *Journal*. It isn't clear whether Murray Energy's supply chain with PPS will survive these bankruptcy challenges. An PPS spokesman declined to comment.

Utility Says Power Plants Will Stay Open During Bankruptcy

Attorneys for FirstEnergy Solutions say the company's coal and nuclear power plants will keep producing electricity while the company undergoes reorganization under bankruptcy.

April 4, 2018, at 10:32 a.m.

f [https://w](https://www.)

RPS

AP

AKRON, Ohio (AP) — Attorneys for FirstEnergy Solutions say the company's coal and nuclear power plants will keep producing electricity while the company undergoes reorganization under bankruptcy.

The FirstEnergy Corp. subsidiary told a U.S. Bankruptcy Court judge in Akron that it should have enough money to remain operating and pay its employees during the reorganization.

FirstEnergy Solutions said while filing for bankruptcy protection on Saturday that it faces billions of dollars in debt and increasing pressure from natural gas power plants.

The company operates two nuclear plants in [Ohio \(/news/best-states/ohio\)](#), and one in [Pennsylvania \(/news/best-states/pennsylvania\)](#). It also has coal-fired power plants in both states.

But FirstEnergy Solutions said Tuesday that the long-term future of the plants remains in question.

Last week, the utility said it intends to shut down its nuclear plants within three years.

FirstEnergy Solutions bankruptcy could take years; consumer impact review begins

Published: April 7, 2018 - 6:40 PM | Updated: April 7, 2018 - 11:06 PM

By Jim Mackinnon

Beacon Journal/Ohio.com

The FirstEnergy Solutions Corp. court case, involving some 14,000 creditors, billions of dollars in debt, a small army of lawyers, plus putting at stake the future of nuclear and coal power plants, could take years to resolve, says a local bankruptcy lawyer.

Meanwhile, efforts have started to look into how consumers may be impacted as the unregulated generation arm of Akron electric utility FirstEnergy Corp. goes through the early stages of the Chapter 11 bankruptcy process.

FirstEnergy Solutions filed for bankruptcy protection in Akron on March 31, which allows it to continue operating while undergoing a court-supervised reorganization. The FirstEnergy subsidiary operates two nuclear power plants in Ohio and one in Pennsylvania, as well as coal-fired power plants.

The bankruptcy filing was hinted as coming as far back as November 2016, when parent FirstEnergy Corp. said it planned to become a fully regulated utility and was looking to sell off power plants and debt-laden FirstEnergy Solutions.

There probably won't be a quick resolution to the complex case, said one legal onlooker.

"It can take, on the short end, five or six years [to resolve]. I would think it can

DOE-17-0427-B-001486

4/9/2018

FirstEnergy Solutions bankruptcy could take years; consumer impact review begins

take longer than that, said Joseph Ferrise, staff attorney for the downtown Akron office of the Chapter 13 trustee, who oversees local individual bankruptcy cases. Ferrise also teaches law classes, including on bankruptcy, at the University of Akron.

Critical documents

With the initial April 3 court hearing behind it, FirstEnergy Solutions now will have about 18 months to file two critical bankruptcy documents, Ferrise said.

The first document will be a disclosure statement that lists assets, liabilities and more, much of it redundant information from other filings, he said. Creditors need the document to make informed business decisions.

The other critical document will be FirstEnergy Solutions' plan of reorganization, he said. It will show, among other things, how much FirstEnergy Solutions intends to pay creditors — and creditors likely will contest at least some of what the plan proposes, Ferrise said.

While one industry analyst last week said parent FirstEnergy Corp. could decide to pay as much as \$2.7 billion to try to quickly resolve the bankruptcy, Ferrise indicated he did not think that was likely — and added if FirstEnergy decided that was its best option, the process could still take years.

The bankruptcy will rack up significant legal expenses, he said. Some of the numerous lawyers involved make as much as \$700 to \$900 an hour, he said.

The end result of the Chapter 11 process will ultimately be a stronger FirstEnergy that is positioned for decades of good financial health and performance, Ferrise said.

"I'm a homer. I hope this goes well," he said. "I think that's a viable and reasonable thing to expect."

U.S. Bankruptcy Judge Alan M. Koschik, who is overseeing the case, is well qualified for the task, Ferrise said. Koschik's background includes previous work as a Chapter 11 bankruptcy attorney.

"He is in his element. He's going to have a real good feel for this case," Ferrise said.

Customers must wait

Residential and business electricity customers of FirstEnergy may also have to wait a while to see how the Chapter 11 bankruptcy could affect them.

4/9/2018

FirstEnergy Solutions bankruptcy could take years; consumer impact review begins
wait a while to see how the Chapter 11 bankruptcy could impact their
pocketbooks.

The Public Utilities Commission of Ohio last week opened a case on its docket seeking to protect Ohio consumers from any adverse impact from the FirstEnergy Solutions bankruptcy filing.

The PUCO has said the bankruptcy will not cause anyone to go without electricity because of measures in place to ensure the continued delivery of power. Ohio law requires local utilities to step in and supply electricity in case a supplier is unable to fulfill its contractual responsibilities.

In its April 4 filing, the PUCO said it cannot guarantee that contracts entered into by FirstEnergy Solutions prior to the bankruptcy filing will not be impacted.

The PUCO filing directs FirstEnergy Solutions to file a report by May 4 saying, among other things, whether it will be able to continue to serve existing retail customers including government aggregations, and to disclose any other material changes.

The Ohio Consumers' Counsel office said it will file comments for consumer protection in the PUCO case.

"FirstEnergy Solutions has proposed in its bankruptcy filing to continue to honor the contracts it has with its customers," the OCC said Friday. "The FirstEnergy utilities known as Cleveland Electric Illuminating, Ohio Edison and Toledo Edison are not part of the bankruptcy and their rates are unaffected."

A FirstEnergy Solutions spokeswoman in early March said bankruptcies largely involve creditors and have little impact on residential customers.

FirstEnergy Solutions cited costly environmental requirements, weak electricity demand and strong competition from cheap, fracked natural gas and renewable energy sources as reasons for needing to reorganize under Chapter 11. The company has 3,076 employees, most of whom work at the power plants, with 118 employees in Akron.

Days prior to the bankruptcy filing, FirstEnergy Solutions told the federal government it intends to shut down and decommission its three nuclear plants, at an estimated cost of more than \$1.8 billion, by 2021. It asked President Donald Trump's administration to intervene to keep the plants running.

While in West Virginia on Thursday, Trump said his administration will look into using emergency powers to keep coal and nuclear plants open. He did not name FirstEnergy in the off-the-cuff comments, which come DOE-17-0427-B-001488

U.S. Coal Mogul Murray Wants to Run Power Plants Too

By **Tim Loh**

April 10, 2018, 12:23 PM EDT

Updated on April 10, 2018, 4:38 PM EDT

From

→ CEO Bob Murray says his company isn't at risk of bankruptcy

→ Plan would be 'culmination' of Murray's life work, he says

Murray Energy Corp. Chief Executive Officer Bob Murray wants to buy coal-fired power plants to shore up his mining company.

An acquisition could happen as early as this year, allowing the company to mine coal, transport it to plants and then burn it to generate power, Murray said on the sidelines of the Bloomberg New Energy Finance Future of Energy Summit in New York.

4/13/2018

U.S. Coal Mogul Murray Wants to Run Power Plants Too - Bloomberg

Murray Energy CEO Bob Murray speaks at Bloomberg New Energy Finance Future of Energy Summit in New York on April 10. Craig Warga

"It'd be the culmination of my life's work," he said. "It's a new concept. If you control the fuel supply, you can price it how you want it."

Murray has mulled such a purchase for at least 15 years but has come close only twice -- both in the past couple of years. The problem has been money, as utilities typically sell off the sites' capacity payments when they close coal fired plants. That creates cash-flow problems for a potential buyer that could fester for several years.

He has his eye on five different plants, including some of the assets of bankrupt <https://www.bloomberg.com/news/articles/2018-04-01/coal-generator-that-trump-tried-to-save-files-for-bankruptcy> FirstEnergy Solutions -- the W.H. Sammis plant in Ohio and Bruce Mansfield facility in Pennsylvania, both of which are for sale. Also attractive is FirstEnergy Corp.'s Pleasants Power Station <https://www.firstenergycorp.com/content/dam/corporate/generationmap/files/Pleasants%20Facts.pdf>, he said. The West Virginia facility is scheduled to close in early 2019.

"If you can dig coal out of the ground, you sure as heck can run a power plant," he said. "We can run power plants better than the utilities can."

FirstEnergy

The possibility of going after FirstEnergy assets is an about face from last summer, when Murray said his company might get dragged into a restructuring by FirstEnergy Solutions. He dismissed that possibility Tuesday.

Murray Energy is in a better position this year as its overseas sales have boomed. The company plans to export 22.5 million tons of coal this year, almost a third of its overall production and the most ever. Much of the credit goes to Javelin Global Commodities, a joint venture Murray helped form in 2015 with, among others, former Goldman Sachs Group Inc. employees. The London-based trader has the potential to grow as global coal demand continues to shift toward Asian markets.

4/13/2018

U.S. Coal Mogul Murray Wants to Run Power Plants Too - Bloomberg

Murray -- who has three sons in their 40s working for the company -- said that in 10 years, Murray Energy could own as many as five coal-fired power plants and produce 110 million tons of thermal coal a year, about a sixth of his forecast for annual U.S. production then. He's not sure if U.S. thermal coal output will have fallen below 650 million tons a year by then, as that will depend on whether the leaders of America's utilities get behind coal.

But if coal slips below 25 percent of the country's power mix, "people are going to freeze in the dark," he said. It's expected to account for 29 percent of utility-scale power generation in 2018, according to government forecasts.

To keep the lights from going out, Murray expects the U.S. government to declare a power-grid emergency so impressive in scale that it would trigger payments to keep some coal and nuclear power plants online.

That controversial action -- under Section 202(c) of the Federal Power Act -- is the "only option right now," he said.

Q. I don't understand the opposition between FirstEnergy and AEP. Don't they operate under the same set of rules?

by AEP Ohio on May 21, 2012

A. AEP Ohio and FirstEnergy are making the transition to a competitive market at different times.

FirstEnergy started the switch in 1999, shortly after Ohio legislators passed Senate Bill 3. This allowed a majority of Ohioans to choose who they wanted to buy generation from.

At the same time, generation rates were reduced by 5 percent and then frozen for five years.

High-cost service territories, such as First Energy, saw a significant number of customers switch to lower-cost generation providers. Low-cost service territories, such as ours, saw little to no switching.

FirstEnergy began to corporately separate its assets with a two-phase, five-year plan. **FirstEnergy received nearly \$7 billion in stranded cost recovery.** The company has continued to recover these costs through 2010.

During the same period, regulators repeatedly asked us to wait to move to a competitive market because our rates were stable and lower than market rates. At the request of state regulators, we contractually committed our generation to serve our customers through 2015. We did the right thing for Ohio and its electric consumers by providing below market generation rates to customers.

Last year, a surplus of power driven by the economic downturn and other forces has driven market rates below AEP Ohio's rates. Regulators have asked us to complete the transition to market.

We're asking for a three-year transition to unwind the contractual and legal obligations we entered into with the support of the Public Utilities of Ohio. This transition will ensure robust competition between strong competitors that will produce the lowest rates possible for all Ohioans while fairly compensating the company for assets currently dedicated to customers, but used by competitors for profit.

From → Fair Transition to Competition

1. tony blankenship permalink

what a load of BS, 2 years ago all the power companies got a rate increase to help pay for the cost of transporting fuel(because of the raise in gas prices). not once did u drop prices when those cost came down instead u gave the management a bigger bonus. now that the cost of transporting said fuel is back to those rate but the fuel itself has gone down you're ask for another raise. someday (and that day is getting near) the average joe will get tired of are politicians pandering to big corporations, i think we need to regulate power companies again and put all new politicians in office so at least our pay hikes will be used for all NEW bribes and just not maintance fees on the OLD bribes.

2. Kaye Presutti [permalink](#)

Well Tony, it's clear you are pissed! However dissatisfied you are with AEP, let me tell you that as a First Energy customer I'm aware that First Energy has been no less generous with their bonuses; the PUCO dealt different deals for AEP and First Energy over this transition period, now the PUCO needs to level the playing field by permitting AEP's graduated rate increase (sadly). Then customers of both companies will hopefully see legitimate competition.

Reply

3. Mark [permalink](#)

I work for HP. We took a pay cut. Same thing. AEP says they want to 'save' jobs...which translates to 'I want to make more money'. What if the workers, bosses, CEO's...etc took a pay cut? Then rate hikes would not have to happen and the AEP employees would be in the same boat as the rest of us. HP could sell computers for hundreds more than they do now...then I wouldn't have to take a pay cut...same thing with AEP.

Reply

4. Elizabeth [permalink](#)

The majority of AEP employees are also AEP customers. So taking a paycut will not solve anything, they still have to pay their electric bills just like everyone else.

Reply

5. Edward Phillips [permalink](#)

Unfortunately for AEP and other "old-line" utilities, the chickens are finally coming home to roost. I worked as a contractor with several old line east coast utilities in the 1980s and 1990s (not AEP). During all of our meetings with management, we noticed that most of the office personnel appeared to be not busy at all – many playing personal games! Also, almost every time we visited the offices, several key management executives appeared to be out playing golf! Since these companies were regulated by state commissions, we couldn't understand the low productivity levels. We later found out that the companies were guaranteed a profit by the State over and above their costs so there was very little incentive, if any, to reduce costs. It didn't help that they were being regulated by incompetent political commissions and audited by unethical accounting firms. To sum up, now that these bloated utilities face competition from companies that are better managed, they must drastically reduce costs and it will be extremely painful for them. It's a shame that the newer workers will have to suffer the layoffs, pension cut-backs, etc. The "old-line" managers who are responsible for the mess are probably long gone after cashing in their stock options and drawing out huge pensions. (reminds me of the problems faced by city, state and federal governments.)

Subject: Invoking Section 202(c) is bad.
Date: Sunday, April 15, 2018 3:13:26 PM

Invoking Section 202(c) to bail out failing and dirty coal plants is stupid. Why not spend money and effort working with cleaner natural gas and clean energy(wind, solar) sources. If FirstEnergy and others like it could not see the writing on the wall that natural gas and other sources of energy were the way they should be moving then they need to die and let forward looking companies take over the market.

Please do not use a fake state of emergency to interfere in the running of the electrical power generation industry. Free market economics and existing regulations are more than adequate to ensure reliable electricity. Also, the mining, transportation, and burning of coal is responsible for far more health issues and deaths than the imagined power outage would. So if there really were an emergency, it would be that we're already burning too much coal. Please act like a Republican and keep big government out of business.

Assuming you'll continue to ignore the interests of taxpayers,

Subject: Do not use section 202.c to keep uneconomical plants afloat
Date: Sunday, April 15, 2018 7:29:41 PM

Secretary Perry appears to be building a case that certain plants are critical to national security in general, in order to be able to apply section 202.c to provide assistance to keep plants afloat. This is the wrong approach to take. The energy industry has to be able to function without major government interference. If an individual operator cannot, it can use existing mechanisms like bankruptcy protection to cope. If this is not enough to keep the grid as a whole healthy, this is a matter for the congress to attend to. Stretching an existing statute beyond all recognition, suggesting that we are eternally at war or in a state of disaster, to help an individual operator is a mockery of the statute's authors and an abuse of the secretary's power.

Subject: Federal Power Action section 202(c)
Date: Sunday, April 15, 2018 3:33:50 PM

Hello,

I am writing as a private US citizen regarding the potential for invoking section 202(c) with respect to FirstEnergy. This power should not be invoked for this case. There is no energy crisis that demands immediate intervention. We are not at war, and the grid is not in any immediate danger. This is a failing business, which should not be rewarded with federal protection at taxpayer expense. They cannot provide energy reliably or cheaply enough on their own, and the market has valued them appropriately. The federal government should encourage the market to better address infrastructure challenges like these, not reward failing investments. By allowing this company to fail, it will create an opportunity for entrepreneurs and investors with more affordable and sustainable business practices.

Even if there were an immediate true crisis that demanded more electricity from the US, scaling up coal production to meet it would have hardly any lead time. Put your faith in American ingenuity, free markets, and opportunity – not fear, inefficient technology, and failing investments.

Sincerely,

Rob L'Heureux

Subject: the latest effort by the sec. of energy to burn coal
Date: Sunday, April 15, 2018 3:19:29 PM

I am unalterably opposed to the latest crying wolf refrain by the Energy Secretary to prop up

domestic old technology coal plants. His arguments are as transparently weak as the damage done to the environment

is great if his latest stunt is approved. On the DOE website are the many examples which

led to a 202c emergency order. NONE of these are remotely comparable to the situation

of First Energy's mothballing of certain of its energy plants due to factors that have

everything to do with competition in the domestic energy marketplace, that is, its bankruptcy, and nothing to do with

resilience of the grid. There has been no concern expressed by anyone in the regions served by these plants that energy supplies

will suffer as a result of these shutdowns. Have any of the affected state utility regulators expressed concern? I

am not aware of this. Nor did Perry cite convincing examples of such in his recent testimony.

So how this can possibly be characterized as a condition requiring imminent emergency invocation of 202c? Are we

doing government by hype and hysteria?

The publicity stunt that this effort represents is not much more than an effort to circumvent the effect upon market supply

forces unleashed by deregulation in the domestic energy supply market by using government authority

to choose winners and losers. It is bad enough this comes from a republican. It is even worse that

his effort is focused upon a genuine loser in the game. It is obscene that his effort is directed at getting more

carbon based energy into the energy use mix. It is exactly the opposite of what we should be doing, and with

government support.

You can't justify approving this emergency invocation of 202c if you believe in basing your

decisions upon careful consideration of all available evidence, as well as what commonly understood

uses of the term "emergency" should mean. Getting caught up in and being swayed by the heated, ridiculously exaggerated

rhetoric of Sec. Perry does no one, especially the domestic energy customer, ANY good at all. Indeed, the inevitable

consequence of approving this request will be higher prices for the end user...something he failed to point out

with nearly the same level of intensity. Curious fact that. Indeed, that dramatic choice he did articulate, between

keeping warm or staying nourished, will be precisely the consequence of allowing these plants to operate with

the higher prices required to keep them afloat.

Are we all supposed to sit back and allow such evidently self contradictory and hysterical rhetoric to dictate

policy for us? I would hope not. But times are very strange these days, and it is hard to say

whether we are still functioning as an enlightened state that makes policy for the greater good

by combining sound reasoning with a rigorous examination of all relevant evidence.

Ben Lichtin

Dear Sirs:

I am writing to ask that you NOT invoke emergency powers that are neither necessary nor likely to be of a defined and temporary nature.

It is clear to me that you are playing politics in order to satisfy your political base and, more demonstrably, your need to placate an irrational and ignorant president.

I ask also that you consider the following likely consequences if you take this action:

- You will be propping up ever-more costly technologies to the detriment of cleaner and cheaper energy sources
- You will CAUSE the premature deaths of citizens to the extent that coal mines and coal fired plants remain in operation
- You circumvent the rule of law and that capriciousness chills the very investments that will provide the resiliency you claim to be seeking
- And, finally, you will not be "draining the swamp", but instead expanding it to the benefit of your donors and the rich and powerful who have access to the levers of government.

I am hopeful that my comments and those of my fellow citizens will be considered in the decision making process.

Sincerely,
Thomas McRae

Subject: Nuclear power support
Date: Sunday, April 15, 2018 8:59:15 PM

To whom it may concern

I am a small business owner in the state of Pennsylvania that uses a significant amount of electric power that is very concerned about the prospect of the nuclear plant shutting down in Shippingport PA.

I understand that natural gas is very inexpensive today but it seems foolish to allow such an incredible asset of the nuclear plant be shutdown and thus wasted forever. If natural gas prices are to rise in the future which could easily happen due to any number of unknowns like issues drilling, well contamination, earthquakes etc we will be in a position where we really regret having lost this capacity.

I am by no means making a plea on an environmental basis or any one specific issue. I believe that we as a community have invested a tremendous amount in this infrastructure and it seems to be very shortsighted to let it go on the basis of cheap natural gas alone. We risk grid resiliency and price stability in the future where it appears that a modest subsidy not too dissimilar to what we do for solar and wind would go a long way toward energy security and stability.

From: Alfred Purzycki
To: AskOE
Subject: Power Action section202(c) - D.O.E. Comment
Date: Sunday, April 15, 2018 7:35:18 PM

This is in regard to the Power Action section 202(c) proposed implementation.

This is the second time the DOE has attempted to subsidize Coal and Nuclear power plants with little justifications, the last time being at the request of a failing First Energy.

Section 202(c) was designed for use in **WARTIME** and **NATURAL DISASTER** to maintain power output.

There is no **WAR** that is impacting the American People at this time.

There is no **NATURAL DISASTER** that is still impacting the American people at this time (except in Puerto Rico, that this administration has ignored.)

Currently the DOE Secretary of Energy declares that grid resilience will be impacted without subsidies to the Coal and Nuclear industry but studies and Major grid operators have already contended that **grid resilience can be maintained and even improved without keeping uneconomic COAL and NUCLEAR plants online**. Today there are about 100 mandatory, enforceable standards, to ensure grid reliability in the United States.

Money proposed for the subsidy of nuclear and coal plants would be better spent for:

- Wind Energy (and associated research)
- Solar energy (and associated research)
- Utility Scale Battery Storage
- Hydro-electric and geothermal
- Natural Gas peaking plants

Wind and Solar will decrease our dependence on foreign sources for petrochemicals, improving our country's security and energy independence. Look at Texas's success in deploying wind turbines; although I think the D.O.E. Secretary has forgotten about Texas.

Utility scale Battery Storage will dramatically improve grid resilience no matter what source of energy involved (as proven successfully in Australia).

These top three can be done for less, in the long run, than attempting to maintain existing, aging and unprofitable energy solutions.

In closing, America needs to look forward, not back, for our energy needs. I personally want something better for myself, my children, my grandchildren and great grandchildren. I own an electric car, I have solar on my roof. I'm trying to do my part to improve our country's energy independence and security. I think this kakistocratical administration's Department of Energy should do their job! Act in the interest of the AMERICAN PEOPLE and not pander to archaic energy industry lobbyists and their feeble attempt to maintain preeminance in a changing world.

Subject: 202c For FirstEnergy
Date: Sunday, April 15, 2018 2:57:09 PM

I'm opposed to using the provisions of 202(c) to rescue FirstEnergy from bankruptcy. While grid stability is a serious concern, maintaining coal-fired power plants will not ensure grid stability, as coal is subject to the same supply fluctuations as other fossil fuels. Grid stability would be better insured by focusing on renewable sources of generation and advancing grid storage technology. Maintaining a system leftover from the mid-20th century will only delay the development of a truly stable and secure energy grid.

From: Doug Diamond
To: AskOE
Subject: Federal Power Action section 202(c)
Date: Monday, April 16, 2018 4:30:21 PM

To whom it may concern -

I am writing to document my opposition to the use of section 202(c) outside of a narrowly defined emergency situation as constituted by a natural disaster, extreme weather incident, or unexpected terrorist incident.

While our grid is definitely in need of upgrade, and ensuring that there is appropriate baseline power generation to support grid stability is vital, this is not the right tool to use. Failure of political will to effect real change to our power structure does not constitute an Emergency.

What has been proposed recently, namely to use this section to distort the market forces that have rightly devalued coal and fuel oil to the point where they are not viable production sources, is backward thinking, and will only harm our ability to build a stable, future-proof grid. It is nothing more than a bailout for companies that do not deserve our tax dollars, because they failed to understand the way energy markets were moving.

It is eminently possible to have a fully stable grid using renewables, natural gas, and nuclear, especially taking advantage of industrial-scale battery or capacitor storage. Both research and real-world practice prove this.

So no, I would not support use of section 202(c) for any purpose other than a narrowly defined, unpredictable disaster event.

Thank you,

Douglas Diamond

Re: Grid Resiliency Pricing Rule
FERC Docket No. RM18-1-000

**COMMENTS OF THE INTERNATIONAL BROTHERHOOD OF ELECTRICAL
WORKERS, LOCAL UNION 1413 IN SUPPORT OF THE PROPOSED RESILIENCY
RULE**

On September 28, 2017, the Department of Energy ("DOE") issued the "Grid Resiliency Pricing Rule" (the "Proposal") directing the Federal Energy Regulatory Commission ("FERC") to adopt a rule requiring operators of organized markets to "ensure that certain reliability and resiliency attributes of electric generation sources are fully valued." Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations in Ohio will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the region.

IBEW Local 1413 strongly supports the Proposal and shares the Secretary's urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members' loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of crucial power plants needed for reliability for some time. FERC has the requisite basis to act now. There is no time for delay. In addition to acting promptly, FERC should also direct organized

International Brotherhood of Electrical Workers

Local Union No. 1413 • P.O. Box 122 • Oak Harbor, Ohio 44871-0122 • 419-497-001540

market operators to issue a comprehensive and enduring set of rules, based on the regulatory language of the Proposal, for the proper compensation of critical power plants. Protracted proceedings undertaken by organized market operators that fail to develop fair, compensatory and transparent rules will only engender market uncertainty and delay in providing sufficient compensation to these facilities, thereby jeopardizing the operation of the very plants that the DOE seeks to maintain in operation.

I. COMMUNICATIONS

II. DESCRIPTION OF IBEW LOCAL 1413

IBEW Local 1413 is a progressive labor organization that represents security professionals in the Generation industry.

III. DESCRIPTION OF IBEW LOCAL 1413'S INTEREST IN PROCEEDING

IBEW Local 1413 is a party to a collective bargaining agreement with the owners of baseload coal and nuclear power plants located in Ohio. As a result, the wages, terms and conditions of employment of our members may be directly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, IBEW Local 1413 members have a direct and substantial interest in this proceeding. As well, the unique perspective of IBEW Local 1413 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in Ohio's electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across Ohio. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in Ohio provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to IBEW Local 1413 members. The Davis Besse and Bayshore generation stations directly employ approximately 144 IBEW Local 1413 members, and the maintenance and capital improvement work on these plants supports the local economy by creating thousands of well-paying union jobs for contractors. In addition, these plants contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed, reliable

facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled (and specifically trained and experienced) employees, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

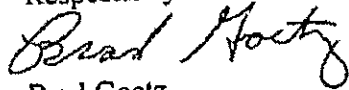

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in Ohio, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, IBEW Local 1413 strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by the comments considered in this proceeding. FERC has thoroughly considered the impact of

electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of pre-mature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Respectfully submitted,

Brad Goetz
President & Business Manager
IBEW Local 1413

Dear Secretary Perry,

Unions, labor and power plant workers across the country applaud the Department of Energy's study examining electricity markets, the value of baseload power and the long-term security and resiliency of the electric grid. Baseload coal and nuclear power plants employ more than 154,000 workers, produce major infrastructure projects that put Americans to work, and support a resilient electric grid.

Baseload power plants have long been the "work horses" of the electric system, providing energy to customers 24 hours a day, 365 days a year. With significant on-site fuel reserves, they provide the resiliency required to keep electricity flowing under all circumstances since their operation is not subject to interruption by extreme events such as weather or attacks on infrastructure that disrupt fuel delivery to other generation resources. Recently, EPA Administrator Pruitt noted as much when he talked about the consequences of an attack on key infrastructure. Our nation's security is dependent on maintaining these plants to support a resilient supply of electricity.

However, numerous baseload power plants have permanently shut down in recent years, and many more are expected to close prematurely in the very near future. Once they are gone, they are gone for good. Baseload generation is under serious threat from market-distorting subsidies and mandates, regulations that target these resources, low natural gas prices and markets that don't value resiliency. We are at a crisis point. Further decline in the number of plants will not only impact the grid and national security, it will cost valuable jobs and discourage industrial development opportunities nationwide. This is an outcome America simply can't afford.

Our baseload power plants and the dedicated, skilled workers who operate them are the lifeblood of their communities. They deliver a strong tax base and support between three and eight times more high-paying jobs than do other forms of electricity generation. We depend on these plants to create a robust workforce, and the country depends on them to support a healthy economy and electricity supply.

Unless action is taken, the long-term viability of baseload power plants along with the jobs and substantial economic opportunities they bring is at risk. And, our national security could be compromised if we don't ensure a resilient grid. We encourage the Administration to take prompt and meaningful action to protect baseload power plants and America's energy future.

Sincerely,

Brad Hart

Rick Perry, Secretary
U. S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

Dear Secretary Perry,

As in previous comments and due to recent weather events, the need for a resilient baseload generation is even more apparent today. It is essential that coal-fired and nuclear baseload generation be kept in the energy mix and be compensated appropriately to make sure they are available when called upon to provide energy to the grid. If coal-fired and nuclear units continue to close prematurely, the reliability of the United States energy grid could be in serious jeopardy. We ask that you issue an emergency order under the Federal Power Act Section 202(c) until the base-load generation issue is resolved. Thank you in advance for your attention to this important matter.

Re: Proposed Grid Resiliency Pricing Rule
RM 18-1-000

Dear Commissioner:

I am writing on behalf of the 115,000 members of the International Brotherhood of Electrical Workers (IBEW) who reside in the Third District, which encompasses the states of Delaware, New Jersey, New York, and Pennsylvania. In this diverse district, we represent hard working men and women from the electric utility, electric generation, construction and railroad industries.

We fully support the Department of Energy's quest to improve our nation's electric grid resiliency. It is our organization's stance that this is a matter of reliability for the public, as well as the security and safe, day-to-day operation of our country.

We believe that the proposed changes can be accomplished in a manner not to affect current market structure. In fact, we believe these measures to be the next logical steps to ensure our grid resiliency for generations to come. Our focus is to make sure these changes are done in a way that preserves the current market structure and to also prepare for the ever-changing demand that our country faces every day. Not only is it our position that these steps can be accomplished, but that it is imperative for America to stay at the forefront of electrical technology.

These types of actions are not new to the industry. FERC and the Regional Transmission Organizations (RTO) have historically valued certain alternatives differently.

The members of the IBEW have been made first hand witnesses to some near catastrophic events due to natural disasters that were averted by a well-balanced energy portfolio; from the Polar Vortex of 2014 to the more recent hurricane Harvey that struck the Gulf States. During each of these disasters, our grid could maintain reliability thanks in

part to on-site, readily available fuel sources that were housed at several generation plants throughout the affected areas. We feel that this is a unique asset that our country's coal and nuclear generation fleet brings to the table. Unfortunately, some of the gas units were unable to stay online because of the interruption in fuel supply.

Going forward, we feel these efforts will ensure multiple fuel sources, as well as protect the resiliency of the grid.

We understand that the proposed timeline may seem daunting. However, we would like to extend our sincerest gratitude for your time and consideration of our views.

Sincerely,

Michael D. Welsh

Rick Perry, Secretary
U. S. Department of Energy
1000 Independence Avenue SW
Washington DC 20585

Dear Secretary Perry:

I write to you on behalf of the Third District of the International Brotherhood of Electrical Workers (IBEW.) The IBEW Third District encompasses the states of Delaware, New Jersey, New York and Pennsylvania. According to a recent DOE/EIO study, "Pennsylvania is one of the top three electricity-generating states in the nation, along with Texas and Florida. Electricity generation regularly exceeds in-state consumption, making the state an important electricity supplier to the Mid-Atlantic region. Pennsylvania ranks second in the nation, after Illinois, in nuclear generating capacity, and nuclear power is the state's largest source of generation. The state's five nuclear stations have provided more than one-third of net electricity generation in recent years."

Unions, labor and power plant workers across the country applaud the Department of Energy's study examining electricity markets, the value of baseload power and the long-term security and resiliency of the electric grid. Baseload coal and nuclear power plants employ more than 154,000 workers, produce major infrastructure projects that put Americans to work, and support a resilient electric grid. These baseload plants are extremely important to our members and their communities.

Baseload power plants have long been the "work horses" of the electric system, providing energy to customers 24 hours a day, 365 days a year. With significant on-site fuel reserves, they provide the resiliency required to keep electricity flowing under all circumstances since their operation is not subject to interruption by extreme events such as weather or attacks on infrastructure that disrupt fuel delivery to other generation resources. Recently, EPA Administrator Pruitt noted as much when he talked about the consequences of an attack on key infrastructure. Our nation's security is dependent on maintaining these plants to support a resilient supply of electricity.

However, numerous baseload power plants have permanently shut down in recent years and many more are expected to close prematurely in the very near future. Once they are gone, they are gone for good. Baseload generation is under serious threat from market-distorting subsidies and mandates, regulations that target these resources, low natural gas prices and markets that don't value resiliency. We are at a crisis point. Further decline in the number of plants will not only impact the grid and national security, it will also cost valuable jobs and discourage industrial development opportunities nationwide. This is an outcome America simply can't afford.

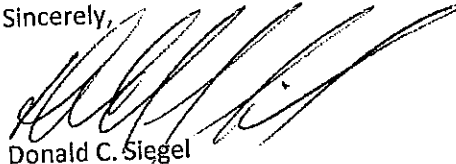

International Brotherhood of Electrical Workers
Third District

Secretary Rick Perry
May 16, 2017
Page 2

Our baseload power plants and the dedicated, skilled workers who operate them are the lifeblood of their communities. They deliver a strong tax base and support between three and eight times more high-paying jobs than do other forms of electricity generation. We depend on these plants to create a robust workforce, and the country depends on them to support a healthy economy and electricity supply.

Unless action is taken, the long-term viability of baseload power plants, along with the jobs and substantial economic opportunities they bring, is at risk. And, our national security could be compromised if we do not ensure a resilient grid. We encourage the Administration to take prompt and meaningful action to protect baseload power plants and America's energy future.

Sincerely,

Donald C. Siegel
International Vice President

*Re: FirstEnergy Solutions' Request for Emergency Relief under Section 202(c) of the
Federal Power Act*

Secretary Perry:

The Natural Gas Supply Association respectfully submits this response to the above-referenced request filed on March 29, 2018 by FirstEnergy Solutions and its affiliates (collectively, FirstEnergy) with the U.S. Department of Energy (Department). For the reasons below, we believe there is no basis to grant this request, nor is there a basis for any action at this time that would interfere with operation of the PJM market or broadly seek to support coal or nuclear power plants. PJM has already written a response to the request stating that, "there is no immediate threat to system reliability."¹ It further stated that it has a detailed and clear process (via the PJM Tariff) to assess and address any concerns posed by the announced plant closures. Markets for electric power are serving consumers well. The Department should not use its authority to interfere in those markets, which would create inefficiencies and raise costs for consumers.

I. Comments of the Natural Gas Supply Association

FirstEnergy requests that the Department use its authority under Section 202(c) of the Federal Power Act to dictate that the owners of merchant coal and nuclear generators in PJM receive a guaranteed return on equity for four years. FirstEnergy requests a remedy that is beyond the

¹ See PJM Interconnection, *Response to FirstEnergy Solutions' Request for Emergency Relief under Section 202 of the Federal Power Act* (March 30, 2018) available at <http://www.pjm.com/-/media/documents/other-fed-state/20180330-response-to-fe-solutions-request-for-emergency-relief.ashx>

Department's authority to provide and that is based on a purported emergency lacking any basis in fact. For these reasons, the Department must deny the request.

Section 202(c) gives the Department authority to order generators to run during emergencies. Put differently, Section 202(c) allows the Department to make the act of generating electricity compulsory when it would otherwise be voluntary or, in some cases, prohibited by environmental laws. FirstEnergy would like to transform Section 202(c) from a narrow "must-run" authority into something it is not: a broad ratemaking authority akin to Sections 205 and 206 of the Federal Power Act. This is evident throughout their request. FirstEnergy does not ask that the Department order any generator to run² – an omission that cannot be squared with the statutory text. Nor does it attempt to determine how many coal and nuclear power plants must be required to run in order to alleviate the "emergency" it asks the Department to imagine. Tellingly, the only meaningful limitation FirstEnergy would impose on the scope of its requested order relates to the type of *compensation* these generators receive, and not whether each generator is necessary to address the supposed emergency.³

Instead of requesting a must-run order tailored to emergency circumstances, as applicants under Section 202(c) normally do, FirstEnergy requests rate relief. FirstEnergy asks the Department to increase the wholesale rates paid to a favored class of generators, and effectively unwind the wholesale market that the PJM stakeholders and the Federal Energy Regulatory Commission (FERC) have worked decades to develop. But Section 202(c) does not give the Department authority to supersede the FERC's authority over wholesale rates conferred in Sections 205 and 206 of the Federal Power Act. Of course, Section 202(c) ensures that generators receive "just and reasonable" terms for their actions carrying out the order. But compensation is not the purpose of Section 202(c). Rather, the reference to just and reasonable terms is only a necessary accommodation for the fact that the generator has been required to run and has therefore incurred costs. Moreover, Section 202(c) was enacted at a time when the Federal Power Commission had authority over the Federal Power Act as a whole, including Sections 205 and 206. Thus, reading Section 202(c) to provide separate ratemaking authority makes little sense within the broader context of the Federal Power Act.

For these reasons, the Department's regulations foreclose FirstEnergy's attempt to use Section 202(c) as an end run around FERC's wholesale rate authority. When it promulgated its

² FirstEnergy requests that the Department order certain generators to "enter into contracts and all necessary arrangements with PJM, on a plant-by-plant basis, to generate, deliver, interchange, and transmit electric energy, capacity, and ancillary services as needed to maintain the stability of the electric grid," and also to order "PJM to promptly compensate at-risk merchant nuclear and coal-fired power plants for the full benefits they provide to energy markets." FirstEnergy Request at 1. The first of these proposed directives would merely require that generators enter into contracts with PJM and does not specify that generation would be compulsory or that unit retirement would be prohibited or altered from the current generator deactivation rules contained in Part V of the PJM Tariff. The second of these directives solely addresses the compensation received by generators subject to the proposed order.

³ See FirstEnergy Request at 31 (excluding from the scope of its request generators that "recover any of their capital or operating costs through rates regulated by a duly authorized state regulatory authority, municipal government, or energy cooperative").

regulations implementing Section 202(c) after enactment of the Department of Energy Organization Act, the Department rightly left rate issues to FERC, stating that “this responsibility is vested in the Federal Energy Regulatory Commission (FERC) and must be addressed in its regulations.”⁴ Thus, in Section 205.376 of its regulations, the Department encouraged the use of existing rate schedules for service under 202(c) orders and made clear that FERC – not the Department – has responsibility for resolving “rate issues.”⁵ Nevertheless, notwithstanding this clear text and without explanation, FirstEnergy requests that the Department – not FERC – “step in and determine the just and reasonable compensation” for a broad swath of generators over a period lasting at least four years.⁶ Neither the Federal Power Act nor the Department’s regulations would authorize the Department to do so.

Not only has FirstEnergy failed to request relief that the Department has authority to provide, it has also failed to identify an emergency that may serve as a predicate for action under Section 202(c). Consistent with common usage of the word “emergency,” Section 202(c) and the Department’s regulatory definition describe emergency events variously as “sudden,” “unexpected,” and “imminent.”⁷ The retirements FirstEnergy wants to prevent are neither sudden, nor unexpected, nor imminent. Most obviously, the three nuclear plants FirstEnergy has proposed to retire would not be deactivated until 2021, and even then, only if PJM determines that they can retire consistent with system reliability. The same is true for all the merchant generators on FirstEnergy’s list, the overwhelming majority of which have not indicated any intention to retire in the near term.

Nor has FirstEnergy established that the retirement of certain uneconomic generators would create an emergency. Although the Department has authority to act in emergencies, it does not have authority over long-term reliability planning on the bulk electric system. That responsibility lies with FERC, its delegate the North American Electric Reliability Corporation, and the system operators themselves, in this case PJM. Each of these organizations has concluded emphatically that the PJM system is reliable. PJM currently has a reserve margin that well exceeds its 2018 target of 16.1%.⁸ Moreover, with respect to the recent Bomb Cyclone on which FirstEnergy’s request relies, PJM has stated that “[e]ven during peak demand, PJM had

⁴ See Economic Regulatory Administration, Energy, *Emergency Interconnection of Electric Facilities and the Transfer of Electricity to Alleviate an Emergency Shortage of Electric Power*, 46 Fed. Reg. 39,984, 39,985 (Aug. 6, 1981).

⁵ 10 C.F.R. § 205.376.

⁶ FirstEnergy Request at 32.

⁷ See 16 U.S.C. § 824a(c); 10 C.F.R. § 205.371.

⁸ U.S. Sen. Comm. on Energy and Nat. Res., *The Performance of the Electric Power System in the Northeast and Mid-Atlantic During the Recent Winter Weather Events, Including the Bomb Cyclone*, Questions for the Record Submitted to Mr. Andrew Ott, Response to Question 1 from Sen. Lisa Murkowski (Jan. 23, 2018) available at <http://www.pjm.com/-/media/library/reports-notice/special-reports/2018/20180220-qfrs-submitted-to-andrew-ott-from-20180123-senate-committee-hearing.ashx?la=en>.

excess reserves and capacity.”⁹ For the foregoing reasons, we believe there is no evidence to grant this request, nor is there any basis for the Department to take any other action that would interfere with operation of the PJM market.

Natural gas is an affordable, clean, and flexible fuel for electric generation. Within PJM specifically, it is a fuel that greatly enhances system reliability and resilience. PJM sits atop the Marcellus and Utica shale plays. These are among the most productive and fastest growing natural gas production areas in the world,¹⁰ with pipeline infrastructure that becomes more robust each year. FirstEnergy ignores these facts as well as other measures that PJM has taken to bolster generator performance such as its phased-in capacity performance rules that provide an incentive for generators to secure firmer fuel supplies, and which have already been shown to reduce forced outages.¹¹ Far from demonstrating an emergency, PJM’s response to the 2014 Polar Vortex and 2018 Bomb Cyclone show careful planning for an increasingly resilient grid.

II. Motion to Intervene

The NGSA hereby moves to intervene in this proceeding. Founded in 1965, NGSA represents integrated and independent energy companies that produce and market domestic natural gas, and is the only national trade association that solely focuses on producer-marketer issues related to the downstream natural gas industry. NGSA encourages the use of natural gas within a balanced national energy policy and supports the benefits of competitive markets. NGSA members trade, transact, and invest in the U.S. natural gas market in a range of different manners, and would be harmed by any exercise of Section 202(c) that restricts market competition and privileges uneconomic coal and nuclear generation. NGSA has consistently advocated for well-functioning power and natural gas markets, policies that support market transparency, efficient nomination and scheduling protocols, just and reasonable transportation rates, non-preferential terms and conditions of transportation services, and the removal of barriers to developing needed natural gas infrastructure. NGSA has a long-established commitment to ensuring a public policy environment that fosters a growing, competitive market for natural gas. NGSA also supports a

Subject: DOE should not bail out the power plants
Date: Monday, April 16, 2018 12:55:43 PM

We've been hearing for years about how the government should NOT be in the business of picking winners and losers. FirstEnergy isn't the victim of a natural disaster and the US isn't actively engaged in a war that's threatening the coal/nuclear power generation sector in any way whatsoever. FirstEnergy is losing money because other sources of power are cheaper and more readily available. Let the market adjust itself. Do not waste taxpayer dollars on a bail-out.

Greg Pavlik
Hudson, OH

Re: Grid Resiliency Pricing Rule
FERC Docket No. RM18-1-000

**COMMENTS OF THE UTILITY WORKERS UNION OF AMERICA, LOCAL
UNION 457 IN SUPPORT OF THE PROPOSED RESILIENCY RULE**

On September 28, 2017, the Department of Energy (“DOE”) issued the “Grid Resiliency Pricing Rule” (the “Proposal”) directing the Federal Energy Regulatory Commission (“FERC”) to adopt a rule requiring operators of organized markets to “ensure that certain reliability and resiliency attributes of electric generation sources are fully valued.” Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations in Ohio will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the region.

UWUA Local 457 strongly supports the Proposal and shares the Secretary’s urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members’ loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of crucial power plants needed for reliability for some time. FERC has the requisite

basis to act now. There is no time for delay. In addition to acting promptly, FERC should also direct organized market operators to issue a comprehensive and enduring set of rules, based on the regulatory language of the Proposal, for the proper compensation of critical power plants. Protracted proceedings undertaken by organized market operators that fail to develop fair, compensatory and transparent rules will only engender market uncertainty and delay in providing sufficient compensation to these facilities, thereby jeopardizing the operation of the very plants that the DOE seeks to maintain in operation.

I. COMMUNICATIONS

All communications, correspondence, and documents related to this proceeding should be directed to the following person:

Eric Cook
President
UWUA Local 457
(b) (6)

II. DESCRIPTION OF UWUA LOCAL 457

UWUA Local 457 is a progressive labor organization that represents individuals in the Electric Generation industry.

III. DESCRIPTION OF UWUA LOCAL 457'S INTEREST IN PROCEEDING

UWUA Local 457 is a party to a collective bargaining agreement with the owners of baseload coal and nuclear power plants located in Ohio. As a result, the wages, terms and conditions of employment of its members may be directly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, UWUA Local 457 members have a direct and substantial interest in this proceeding. As well, the unique perspective of UWUA Local 457 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in Ohio's electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across Ohio. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in Ohio provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to UWUA Local 457 members. UWUA 457 has approximately 250 members who work at the Sammis coal generating station. The maintenance and capital improvement work on these plants also supports the local economy by creating hundreds of well-paying union jobs for contractors during plant outages. In addition, these plants contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed,

reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled (and specifically trained and experienced) employees, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in Ohio, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, UWUA Local 457 strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by

the comments considered in this proceeding. FERC has thoroughly considered the impact of electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of premature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Respectfully submitted,

Eric Cook
President
UWUA Local 457

Sirs, in particular clueless Secretary Perry,

From wanting to shutdown the Dept of Energy to deciding it must be used to keep Trump supporters out of bankruptcy is quite a leap. Not a leap of faith as I seriously doubt anyone in the country that isn't either the owner of FirstEnergy or a coal company employee has any faith in the coal business or this proposal.

The Federal Government of the USA should not be bailing out failed businesses that aren't able to compete. There is an Executive branch, it can request to the Legislative branch that the situation could be address in a proper manner. Sadly Mr. Perry is slightly out of touch for understanding what a national emergency is. A failing coal mine is not a national emergency. Of course, if we shut down all work on safeguarding our nuclear weapons then we have have three things; money for coal, a serious loss of deterrence and no counter to Russia/China and the other nuclear nations. But Secretary Perry would keep a promise he made to the voters. So there's that.

Coal will have uses, but powering America with polluting plants that cost more to run will hopefully not be the norm. Coal plants cannot adjust to the modern economy/environment. They are slow to start, slow to adjust generation capabilities and clearly are untenable without assistance.

Putting effort into modernizing the grid and securing the grid's infrastructure is worth Federal dollars. Bailing out a business is not a worthy goal. It is definitely not a national emergency.

Dear DOE,

As the Business Manager of I.B.E.W. Local 459, I previously sent a correspondence on behalf of the nearly 1900 members I represent asking for the government to take action in this matter to support our electric generation plants.

We are asking your consideration to support base-load generation. The nuclear and coal-fired units must be compensated appropriately for their full cost of operation to maintain these important assets. They are needed for grid resiliency, support of our families and the tax base of the communities where the plants are located. The closure of these facilities is devastating in many ways. We urge you to issue an emergency order pursuant to Federal Power Act Section 202(c).

Thank you for your time and consideration on this very important matter.

Paulibew459@gmail.com

II. DESCRIPTION OF IBEW LOCAL 459

IBEW Local 459 is a progressive labor organization that represents approximately 1,850 individuals working in the utility and baseload generation industry in Pennsylvania.

III. DESCRIPTION OF IBEW LOCAL 459'S INTEREST IN PROCEEDING

IBEW Local 459 is a party to collective bargaining agreements with owners of large baseload coal power plants located in Pennsylvania. As a result, the wages, terms and conditions of employment of our members may be directly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, IBEW Local 459 members have a direct and substantial interest in this proceeding. As well, the unique perspective of IBEW Local 459 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in Pennsylvania's electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across Pennsylvania. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in Pennsylvania provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to IBEW Local 459 members. The Keystone, Conemaugh, Homer City, Shawville and Seward generating stations produce approximately 6700 MW of power along with directly employing approximately 675 IBEW Local 459 members, and maintenance and capital improvement work on these plants supports the local economy by creating hundreds of well-paying union jobs for contractors. In addition, these plants contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed, reliable

facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled (and specifically trained and experienced) employees, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

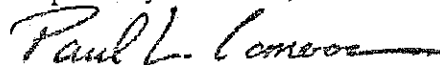

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in Pennsylvania, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, IBEW Local 459 strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by the comments considered in this proceeding. FERC has thoroughly considered the impact of

electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of pre-mature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Subject: Bailing out Coal & Nuclear?????
Date: Tuesday, April 17, 2018 10:25:58 PM

What a crock of manure! Let the coal industry die in its own filth. Feel sorry for the coal miners? Train them for other jobs!

On Thursday, Perry admitted that the failure of his proposed coal compensation rule led him to consider using Section 202(c) to keep coal plants like those owned by FirstEnergy open. Perry's remarks in front of the House Subcommittee on Energy suggest he's hoping to build a case for the use of Section 202(c) by casting the current state of affairs in the US as an emergency.

"When we look at national security in particular, if you're in New York City and Wall Street were to lose power, I think anyone would say that puts our national security in jeopardy," Perry said.

The emergency exists on a personal level, too, the secretary asserted. "Why should any one be put in the situation to choose between turning the lights on and keeping my family warm?" Perry said, which seems to be a reference to how the natural gas supply is divided between residential heating and electric generation use. Perry added later, "It is imperative that we don't allow political decisions to be made relative to our... power security in the country." It was unclear to which political decisions the secretary was referring.

Subject: Use of section 202(c) to bail out market losers
Date: Tuesday, April 17, 2018 2:23:06 AM

Dear sir,

I learned about the DOE plans to bail out bankrupt company FirstEnergy by invoking the authority conferred under section 202(c) to subsidies the continuing operation of its power plants.

I note that no grid operators seem to have requested such action, and that the general consensus is that there is a surplus of power generation available. In fact, the General Electric company is experiencing a downturn in the sales of its gas turbines, which it justifies by invoking this surplus.

It is also recognized that the competitive pressure on coal and nuclear power plants is caused by the low price of gas, which is due to the significant production increase thanks to the use of fracking technology. This administration has called for the growth of oil and gas production, which would certainly lead to a decrease in the price of gas, and more competitive pressure on coal and nuclear power plants.

Market conditions lead energy companies to migrate from coal and nuclear to gas and renewable energy simply due to their lower cost. This is freedom in action.

Apparently this administration does not like free market, and it seems to prefer controlling the economy by fiat. The general consensus is that this will lead to increased electricity price, lowering the purchasing power of the American people.

This begs a question: has the federal government decided to transform our free economy into a state-controlled one?

Has the current administration been infiltrated by communists?

Thank you.

Re: Intervention of the New Jersey Division of Rate Counsel in FirstEnergy
Solutions Corp.'s Request for Emergency Action by the Department of
Energy under Section 202(c) of the Federal Power Act

Dear Sir/Madam:

This office represents the New Jersey Division of Rate Counsel ("NJDRRC") regarding FirstEnergy Solutions Corp.'s ("FES") Request for Emergency Action under Section 202(c) of the Federal Power Act submitted to the Department of Energy ("DOE") on March 29, 2018. On April 5, 2018, the NJDRRC submitted a Motion to Intervene to DOE Secretary James Richard Perry.

Subsequent to the NJDRRC's submissions, the DOE revised the section of its website regarding the DOE's Use of Federal Power Act Emergency Authority, stating the "DOE has established the AskOE@hq.doe.gov email address for the receipt of all materials related to Federal Power Act section 202(c). All public comments and requests should be sent in writing to AskOE@hq.doe.gov." The website also noted "[t]he provision of this process for submission of correspondence or comments on any pending application is for purposes of ensuring the receipt by the appropriate office and personnel within the Department."

Accordingly, the NJDRRC now re-submits its previously submitted Motion to Intervene to the AskOE@hq.doe.gov address. The NJDRRC reserves all rights in relation to the initial Motion to Intervene and Comments as of the time they were submitted to Secretary Perry.

Re: Motion of New Jersey Division of Rate Counsel to Intervene

Dear Secretary Perry, Assistant Secretary Walker, and Deputy Assistant Secretary Jereza:

Attached is New Jersey Division of Rate Counsel's ("NJRC") Motion to Intervene in the proceeding concerning FirstEnergy Solutions Corp.'s ("FES") Request For Emergency Action Under Section 202(c) of the Federal Power Act. NJRC is the administrative agency charged under New Jersey Law with the general protection of the interests of utility ratepayers. *N.J.S.A.*

52:27E-50 *et seq.* NJRC is also a member of PJM Interconnection L.L.C., which will be affected by this FES request. NJRC opposes this FES request for emergency action. If this request is not denied outright, there should be a 60 day comment period, as requested by the Electric Power Supply Association *et al* on March 30, 2018.

Respectfully submitted, ,

A handwritten signature in black ink that reads "Stefanie A. Brand". The signature is written in a cursive, flowing style.

Stefanie A. Brand, Esq.
Director, New Jersey Division of Rate Counsel

UNITED STATES OF AMERICA
BEFORE THE
DEPARTMENT OF ENERGY

Request for Emergency Order Pursuant)
To Federal Power Act Section 202(c) By)
FirstEnergy Solutions Corp.) DOE Docket No. _____

MOTION OF NEW JERSEY DIVISION OF RATE COUNSEL TO INTERVENE

The New Jersey Division of Rate Counsel (“NJRC”), by and through its counsel, hereby moves to intervene in the above-captioned proceeding and protests the March 29, 2018 Request for Emergency Order Pursuant to Federal Power Act Section 202(c) by FirstEnergy Solutions Corp. (“FES”), pursuant to Rules 211 and 214 of the Federal Energy Regulatory Commission’s (“Commission”) Rules of Practice and Procedure, 18 C.F.R. §§ 385.211 and 385.214.

I. PROCEDURAL BACKGROUND

On March 29, 2018, FES issued a request by letter (“Request”) to the Honorable Rick Perry, US Secretary of Energy, requesting that the Secretary use emergency authority under Federal Power Act Section 202(c) to find that an emergency condition exists in the PJM Interconnection L.L.C. (“PJM”) territory requiring immediate attention. In its Request, FES asks that the Secretary order “certain existing nuclear and coal-fired generators” to contract with PJM for energy, capacity and ancillary services to “maintain the stability of the electric grid.” FES also requests that the Secretary order PJM to “promptly compensate at-risk merchant nuclear and coal-fired power plants for the full benefits they provide.” The Request has been served on over 100 affected parties.

II. MOTION TO INTERVENE

NJ Rate Counsel is the administrative agency charged under New Jersey Law with the general protection of the interests of utility ratepayers. *N.J.S.A. 52:27E-50 et seq.* As the regulatory agency charged with protecting the utility ratepayers in the State of New Jersey, NJ Rate Counsel's participation is unique and in the public interest. Pursuant to C.F.R. §385.214(b)(2), NJ Rate Counsel is an "entity" within the meaning of Rule 214(b)(2) and NJRC accordingly moves for intervention.

If the FES Request is granted, cost responsibility for payments made pursuant to the Emergency Order may be recovered from consumers throughout the PJM region, including New Jersey. NJRC strongly opposes the Request and reserves the right to supplement this pleading to explain why it is unjust and unlawful.

NJ Rate Counsel will not be adequately represented by any other party to this proceeding, but may join with similarly situated entities. Good cause exists to grant this Motion to Intervene in this proceeding as NJ Rate Counsel represents NJ ratepayers directly affected by the FES request and is therefore a stakeholder in the outcome of the proceeding.

III. SERVICE OF DOCUMENTS

The following persons are designated by NJRC to receive service and communications on its behalf with regard to this proceeding:

Stefanie A. Brand, Esq.
Director, New Jersey Division of Rate Counsel
140 East Front Street
Trenton, NJ 08625
Phone: (609) 984-1460
Fax: (609) 292-2923
Email: sbrand@rpa.nj.gov

Brian Lipman, Litigation Manager
Henry M. Ogden, Esq.
Felicia Thomas-Friel, Esq.
140 East Front Street
P.O. Box 003
Trenton, NJ 08625-003
Phone: (609) 984-1460
Fax: (609) 292-2923
Email: blipman@rpa.nj.gov
hogden@rpa.nj.gov
fthomas@rpa.nj.gov

IV. STATEMENT OF OPPOSITION

Rule 214(b)(1) requires the movant to state its preliminary position. NJRC opposes the relief sought by FES. The available evidence, not cited in the Request, demonstrates that no need exists for the requested relief and certainly no emergency exists that would justify application of Section 202(c) of the Federal Power Act.

NJRC respectfully urges the Department to give all interested parties sufficient time to present their responses to the FES Request before ruling on the Request. Accordingly, NJRC supports the March 30, 2018 filing by the Electric Power Supply Association and other organizations requesting a 60-day comment period.

V. CONCLUSION

For all the foregoing reasons, NJRC respectfully requests that the Department grant NJRC's motion to intervene in this proceeding, and, if the Department does not reject the FES Request outright, provide all interested parties 60 days to file comments on the Request.

Respectfully submitted,

NEW JERSEY DIVISION OF RATE COUNSEL

Re: Section 202(c) Relief for Baseload Power Plants

Dear Secretary Perry:

I am writing on behalf of the active and retired members of the United Mine Workers of America. The livelihoods of UMW members, their families, and their communities are critically dependent upon preserving and protecting the economic viability of the nation's fleet of coal-based power plants. These plants are subject to unfair competition from subsidized energy sources and market rules that do not value their unique benefits to the reliability and resiliency of the nation's electric power grid.

We supported your proposed Grid Resiliency Pricing Rule, and were disappointed that FERC rejected the rule in favor of pursuing a "holistic" assessment of the multiple challenges to electric reliability and resiliency posed by extreme weather events, terrorist acts, unfair regulatory pricing regimes, and other factors. We do not believe that this study, and any related FERC action, can be undertaken in a time frame that will provide meaningful relief from the unending stream of announced baseload plant closures. FERC indicates that some 26,000 Megawatts of coal and nuclear baseload is expected to close within just the next two years.

The recently announced FirstEnergy Solutions bankruptcy - presaging the near-term closures of six large coal and nuclear facilities serving the Midwest and Mid-Atlantic regions - makes clear the urgency of these threats to national energy security, and to the welfare of thousands of workers and their communities.

UMWA respectfully suggests a two-prong approach to address the current and pending threats to electric reliability and resiliency posed by the ever-increasing share of electric generation provided by subsidized intermittent renewable resources and natural gas plants subject - to a large degree - to interruptible gas supplies.

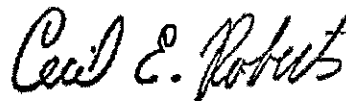

First, we believe that it is timely and appropriate for you to exercise your authority under Section 202(c) to provide immediate relief for the coal and nuclear baseload facilities that are at risk due to the FirstEnergy Solutions bankruptcy. Just one of these plants - the relatively new Pleasants generating station in West Virginia, supports 27% of the local tax base while providing highly-paid jobs to hundreds of workers in the utility, coal mining, and transportation sectors. The recent NETL analysis of the Bomb Cyclone event documents the vital role of baseload generation such as Pleasants and the other bankrupted FirstEnergy Solutions plants in avoiding a catastrophic collapse of the eastern grid.

Second, with respect to the much larger number of coal and nuclear baseload facilities operating in "competitive" markets, we recommend that DOE consider the application of other authorities available to the Department to help minimize the ongoing premature retirement of this capacity. At the same time, DOE should support, through its own modeling capabilities, an accelerated, action-oriented conclusion to FERC's holistic analysis of reliability and resiliency.

We suggest this bifurcated approach because a more limited, targeted exercise of 202(c) authority is consistent with the regulatory history of this provision, while the immediate nature of the risks to the eastern electric grid posed by the FirstEnergy Solutions bankruptcy cannot be addressed in a timely manner by the FERC process.

Thank you for your consideration of UMWA's views. I would be happy to discuss them further with you at any time.

Sincerely,

Cecil E. Roberts

April 10, 2018

Honorable Rick Perry, Secretary
Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

Dear Secretary Perry

(b) (6) I am writing to ask that you reject FirstEnergy's subsidiary First Energy Solution's (FES) request under section 202(c) of the Federal Power Act for a declaration of emergency. Our situation is not an emergency. As PJM has made clear: "Nothing we have seen to date indicates that an emergency would result from the [FirstEnergy] generator retirements."

As one who endorses a free-market economy, we know such inventions would be wrong and counterproductive. Granting FirstEnergy's request would be very disruptive to competitive markets and on that basis alone should be rejected.

FirstEnergy has a long track record of bad management decisions that have resulted in its ratepayers having to pay some of the highest electricity rates in the country. To grant this request would be another ratepayer bailout for bad management. Beginning in the 1970s with the decision to build 9 nuclear units, FirstEnergy management has made a series of bad decisions. The mismanagement of the construction of the Perry I and Beaver Valley II nuclear units resulted in \$9 billion in cost overruns. Most of these costs were passed on to ratepayers in the 1980s even though these units represented excess capacity in the FirstEnergy generation portfolio. Only high rates and billions of dollars in "stranded cost" recovery in the form of a "competitive transition charge" have likely kept First Energy Solutions from declaring bankruptcy a long time ago.

Additionally, FirstEnergy has used a second phony argument for claiming it deserves a bailout. It claims it is not receiving sufficient compensation for the "unique benefits" that its nuclear units provide. FirstEnergy has been attempting to get the Ohio and Pennsylvania legislatures to give it a bailout in the form of "Zero Emissions Credits", another ratepayer charge. However, despite the myth that nuclear plants are a clean source of energy, the fact is they routinely vent some of the deadliest gases known to exist. And, the process to make commercial grade fuel for nuclear plants contributes to Climate Change.

Mr. Secretary, enough is enough. I urge you to do the right thing on behalf of the millions of ratepayers, not only in the FirstEnergy service territory, but throughout the PJM Interconnection: put an end to this history of gouging ratepayers to cover inept management.

Ronald Shissler

Re: Comments of the American Wind Energy Association on the Request for Input on the Process for Considering Applications under section 202(c) of the Federal Power Act and the March 29, 2018 Request of First Energy Solutions for an Emergency Order Thereunder

Submitted via: AskOE@hq.doe.gov

The American Wind Energy Association (“AWEA”) hereby respectfully submits these comments in response to the Department of Energy’s (“DOE”) request for input on the process for consideration of applications under section 202(c) of the Federal Power Act (“FPA”) by the Secretary of Energy.¹ AWEA’s comments largely respond to the March 29 “emergency order” application made by FirstEnergy Solutions, on behalf of certain of its subsidiaries (collectively, FirstEnergy),² requesting that the Secretary of Energy require PJM Interconnection and, by extension, electricity consumers in the PJM region, to provide “full cost recovery” for certain merchant generating plants in its footprint. The request should be rejected as FirstEnergy has neither demonstrated the existence of an emergency that would support action by Secretary of Energy under Federal Power section 202(c), nor shown that its requested relief is reasonable under that section of the FPA or any other thereunder.

¹ 16 U.S.C. § 824a(c) (2017).

² A day prior to the request, FirstEnergy Solutions filed notice with PJM that three of the company’s nuclear power plants would be deactivated or sold during the next three years. On March 31 FirstEnergy Solutions, its subsidiaries and FirstEnergy Nuclear Operating Company filed voluntary petitions under Chapter 11 of the Federal Bankruptcy Code with the U.S. Bankruptcy Court in the Northern District of Ohio in Akron.

I. Process for Considering 202(c) Applications: Should Only be Used to Address Imminent Emergencies

At this time, AWEA does not offer detailed comments on a generic process under which 202(c) applications should be addressed. However, in general, we think that DOE should consider such applications in a transparent manner—providing notice to all interest stakeholders of the application. In addition, to the fullest extent possible, DOE should seek comment from interested stakeholders before taking action on a specific application; if an emergency situation exists that does not afford time for comment prior to taking action on an application, DOE should strive to seek comment thereon immediately after taking action.

Section 202(c) is expressly limited to “emergencies” or other “sudden” events, and DOE acknowledges on its own website that it only enables the agency to impose temporary measures due to an “emergency” or other “sudden” circumstance.³ Since section 202(c) provides a narrow and limited mechanism for the Secretary “to require temporary connections of facilities and such generation, delivery, interchange, or transmission of electric energy” during emergencies, it should only be used in circumstances that truly meet that standard. While section 202(c) does not define either “emergency” or “sudden,” the dictionary definitions of these words reinforce that they mean an imminent crisis that is often unexpected.⁴ Accordingly, any order issued under section 202(c) should, consistent with the statutory mandate and implementing regulations, be a

³ DOE’s Use of Federal Power Act Emergency Authority,” available at <https://www.energy.gov/oe/services/electricity-policy-coordination-and-implementation/other-regulatory-efforts/does-use>.

⁴ See “Emergency,” BLACK’S LAW DICTIONARY 2d Ed., <https://thelawdictionary.org/emergency/> (“Situation requiring immediate attention and remedial action. Involves injury, loss of life, damage to property, or catastrophic interference with the [sic] normal activities. A sudden, unexpected, or impending situation”); “Sudden,” OXFORD ENGLISH DICTIONARY ONLINE, <https://en.oxforddictionaries.com/definition/sudden> (“Occurring or done quickly and unexpectedly or without warning.”).

current or imminent emergency and the order should be temporary in nature—although it should be able to be extended if an emergency continues.

The Secretary should summarily dismiss applications for an emergency order if the evidence does not support a finding that the emergency is present or imminent. Neither section 202(c) nor the DOE's implementing regulations contemplate broad, protracted intervention in wholesale energy markets. As discussed further below, the Secretary's emergency authority simply cannot be invoked based on claims that plant retirement trends and over-reliance on a particular type of generation may pose reliability challenges some years in the future.

II. FirstEnergy's 202(c) Application

FirstEnergy has not demonstrated the existence of an emergency within the meaning of section 202(c) and, therefore, the Secretary of Energy should reject the request.

The crux of FirstEnergy's claim is that an emergency exists because of the retirement of merchant coal and nuclear plants that it alleges are necessary for the reliable and resilient operation of the grid in the PJM region, which would otherwise be overly dependent on other forms of generation that lack fuel security. FirstEnergy asserts that the Federal Energy Regulatory Commission ("FERC") and PJM have not done enough to prevent coal and nuclear plant retirements, arguing, among other things, that PJM markets do not adequately compensate the claimed reliability and resiliency benefits of traditional baseload units with onsite fuel supplies.

FirstEnergy's general claims concerning the potential adverse impacts of coal and nuclear plant retirements in PJM do not establish the existence of an emergency within the meaning of section 202(c), let alone one that would justify imposing cost of-service payments for merchant

plants on consumers in PJM for at least a four-year period. FirstEnergy's claimed "emergency" is, at the end of the day, based on economics.

FirstEnergy contends that merchant coal-fired and nuclear plants in PJM are inadequately compensated for the reliability and resilience benefits they provide. DOE's regulations specifically state, however, that "[s]ituations where a shortage of electric energy is projected due solely to the failure of parties to agree to terms, conditions or other economic factors relating to service, generally will not be considered as emergencies unless the inability to supply electric service is imminent."⁵ Moreover, section 202(c) unambiguously requires that any compensation required by the Secretary be "just and reasonable,"⁶ and an unjustified out-of-market subsidy to one class of resources would certainly not meet that test.

For the sake of argument, even if there is a threat, it is certainly not imminent. The request by FirstEnergy cites plant retirements that may occur in the next several years, which does not demonstrate an "imminent" inability to supply electric service in PJM that could possibly justify characterizing the situation in PJM as an "emergency" within the meaning of section 202(c). For example, the nuclear facility closures upon which FirstEnergy primarily relies are scheduled to retire 2-3 years from now.⁷ In addition, FirstEnergy cites facilities that may retire—a mere possibility does not rise to an imminent crisis.⁸ There is simply no "emergency" or "sudden" event requiring a handout to coal and nuclear generation.

⁵ 10 C.F.R. § 371 (2017).

⁶ 16 U.S.C. § 824a(c) (2012).

⁷ FirstEnergy at 8, 20 (noting that Davis-Besse, Perry, and Beaver Valley are scheduled to retire in 2020 or 2021).

⁸ *Id.* at 21 (noting that units at the W.H. Sammis coal-fired plant "are in danger of being closed.")

In a March 30, 2018 letter to the Secretary of Energy, PJM responded to FirstEnergy's request. PJM stated without reservation that there is no immediate threat to system reliability. It also emphasized that plant retirements in the region are subject to review by PJM, which has "a range of tools available" to address any identified resource adequacy or reliability problems associated with plant retirements, including "offering full cost of service compensation . . . to induce assets to remain temporarily online." As also noted by PJM:

PJM does not believe that operating outside of the market to preserve a particular class or type of generation is needed at this time for reliability. The markets have been resilient in attracting new investment. In addition, a variety of tools exist as a backstop should specific generation be needed in a particular area.⁹

In addition, PJM's press statement comprehensively rebutted FirstEnergy's claims:

This is not an issue of reliability. There is no immediate emergency. Diversity of the fuel supply is important, but the PJM system has adequate power supplies and healthy reserves in operation today, and resources are more diverse than they have ever been. Nothing we have seen to date indicates that an emergency would result from the generator retirements. The potential for the retirements has been discussed publicly for some time. In anticipation, PJM took a preliminary look at the effect of the retirements on the system. We found that the system would remain reliable. We have adequate amounts of generation available.¹⁰

The purported problem prompting the March 29 Request is also the same one that was the subject of the Secretary's October 10 NOPR.¹¹ FERC already considered these same arguments in the proposed grid resilience pricing rule.¹² Indeed, the identical arguments

⁹ U.S. Sen. Comm. on Energy and Nat. Res., The Performance of the Electric Power System in the Northeast and Mid-Atlantic During the Recent Winter Weather Events, Including the Bomb Cyclone, Questions for the Record Submitted to Mr. Andrew Ott, Response to Question 1 from Sen. Lisa Murkowski (Jan. 23, 2018).

¹² *Reliability and Resilience Pricing, Order Terminating Rulemaking Proceeding, Initiating New*

FirstEnergy raises in its request were largely rejected by FERC in response to Secretary Perry's proposed grid resiliency pricing rule.¹³

In dismissing that proposal, FERC found that requiring full cost recovery for fuel-secure merchant generating facilities was not justified. While the January 8 Order noted that FirstEnergy and other commenters alleged grid resilience or reliability issues due to potential retirements of particular resources, FERC found “that these assertions do not demonstrate the unjustness or unreasonableness of the existing RTO/ISO tariffs.”¹⁴ Instead, FERC held that none of the participants in the rulemaking, including FirstEnergy (which filed extensive comments), had demonstrated that existing tariffs were unjust and unreasonable or that the proposed cost-based rates for select generators were just and reasonable.¹⁵ In reaching this conclusion, FERC relied on “extensive comments” from PJM and other system operators which identified no “past or planned generator retirements that may be a threat to grid resilience.”¹⁶ FirstEnergy is now asking the Secretary to second-guess FERC's expert findings on a record that was fully developed.

To justify its request, FirstEnergy relies primarily on a recently released National Energy Technology Laboratory report (“NETL Report”) that incorrectly concludes that power plants with onsite fuel were critical to preserving “resiliency” during the “Bomb Cyclone” in late

Proceeding, and Establishing Additional Procedures, 162 FERC ¶ 61,012 (Jan. 8, 2018) (“January 8 Order”).

¹³ *Id.*

¹⁴ January 8 Order at P 1.

¹⁵ *See id.* at PP 14-16.

¹⁶ *Id.* at P 15.

December to early January.¹⁷ The NETL Report departs from the majority of studies on the subject. This departure is primarily due to an erroneous conclusion in the report: since coal generation increased more in comparison to other forms of generation during stressful winter events, it was assumed as a sign that coal provided resiliency. The actual explanation is far simpler: there are many coal units that are rarely used due to their high-cost, and thus those coal plants are only used when demand and electricity prices are far higher than usual.¹⁸ PJM's analysis of its systems performance during that weather event undermines FirstEnergy's claims about the importance of onsite fuel. Most generator failures during the "Bomb Cyclone" event were due to equipment failures, not a lack of onsite fuel, so coal plants experienced a failure rate comparable to that of other energy sources.¹⁹ Further, many types of generators far outperform coal and nuclear generators in their capability to provide essential grid reliability services like flexibility, frequency regulation, and primary frequency response, as noted in a PJM chart included in DOE's August 2017 Staff Report.²⁰

DOE's Staff Report also contradicts FirstEnergy's claim that there is an emergency threat of generation shortages, noting that "All regions have reserve margins above resource adequacy

targets.”²¹ This was affirmed by NERC’s testimony to FERC that “the state of reliability in North America remains strong, and the trend line shows continuing improvement year over year,”²² as well as FERC staff analysis.²³ More recent NERC analysis indicates that reserve margins in PJM over the next several years will be around 30 percent, nearly twice the target level of 16.6 percent, and could go as high as 60 percent if planned generation additions materialize.²⁴ PJM’s own analysis has demonstrated that once reserve margins exceed 20 percent, the marginal benefit of additional reserve capacity for reducing customer outages is negligible.²⁵

Moreover, generation shortfalls account for a small fraction of customer electricity outages, with the vast majority caused by transmission and distribution system failures during extreme weather. The Rhodium Group found that generation inadequacy accounted for less than 1/10,000th of all customer-hours of outages, with fuel supply emergencies an even smaller share at fewer than 1 in 1.4 million.²⁶ Similarly, analysis in Public Utilities Fortnightly found that “distribution system outages appear to impose roughly two orders of magnitude more minutes of outage on customers than does resource adequacy . . . 146 compared to 1.2 minutes a year.”²⁷

Allocating finite ratepayer money to subsidizing uneconomic and unneeded generation rather than strengthening congested and antiquated transmission and distribution infrastructure will only harm reliability and resilience.

FirstEnergy is seeking out-of-market profit guarantees for an entire class of resources throughout PJM's territory. As such, the request would impair competitive wholesale markets, not only undermining a policy meant to protect consumers but also the investment decisions made throughout the energy sector. FERC has prudently instituted proceedings to further analyze and address the issues raised by the Secretary of Energy's proposed rule (considering whether pro-competitive market solutions are warranted), and those proceedings are ongoing and should not be undermined. FirstEnergy is clearly attempting to sidestep the involvement of interested stakeholders and the ability of FERC to consider matters that are rightfully within its jurisdiction and consider solutions, if warranted, consistent with its statutory mandate.²⁸ It would be inappropriate to allow FirstEnergy to seek essentially the same relief from the Secretary of Energy that FERC, applying its exclusive jurisdiction over the rates, terms, and conditions of wholesale sales of electricity, found to be unjustified.

III. Conclusion

For the foregoing reasons, AWEA strongly disputes the notion that drastic intervention in the markets using the Secretary's FPA section 202(c) emergency authority, or any other section

²⁸ Of note, FirstEnergy did not seek rehearing of FERC's January 8 Order.

under the FPA, is an appropriate solution to the concerns raised in FirstEnergy's application and respectfully requests that the Secretary deny FirstEnergy's request for an emergency order.

Sincerely,

/s/ Gene Grace

Secretary Rick Perry
U.S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

Dear Secretary Perry,

The Energy and Commerce Committee has held numerous hearings over the past four years to examine all aspects of how American electricity is generated and priced into the competitive markets. After hearing testimony from industry experts and government officials, we are no closer to solving the complex question of how to provide a secure and resilient grid. We know recent severe weather along with cyber and physical threats, pose enormous challenges to grid reliability and resilience. The American consumer should not have to worry about the next cold weather event or cyber-attack.

I believe it is time for you to invoke his authority under Section 202(c) of the Federal Power Act or any other emergency authority the President or Secretary of Energy may have. We believe 202c or the Defense Production Act are appropriate mechanisms to protect the grid. The law gives authority to the Secretary when emergency conditions exist such as a shortage of electricity due to various reasons. The law also states, "or other causes" that threaten the availability of electricity. I believe there are important "other causes" which haven't adequately been addressed by FERC and the ISO's and RTO's.

Our electrical generation system and grid are changing very quickly, as these changes evolve we need to make sure these changes do not have unintended consequences. The rapid rise of natural gas electrical generation has proven to be a fantastic asset and something I will continue to support. However, as quickly as this resource develops, I'm afraid we are overlooking the potential downside associated with being too reliant on one fuel source. Especially a fuel that is dependent upon pipeline infrastructure that many states refuse to allow to be built.

In testimony on January 18th of this year, before the Senate Energy and Natural Resources Committee, Gordon van Welie, President and CEO of ISO New England stated, "we've known for several years that when it gets cold New England does not have sufficient natural gas supply

infrastructure to meet demand for both home heating and power generation". Now is the time for this administration to act.

There are three very good reasons to invoke emergency measures. America faces an immediate national security threat of a cyber-attack focused on our electric generation industry and energy delivery systems. Our coal and nuclear fleets provides the resource capacity cushion needed to mitigate a potential attack, and a secure fuel source in case a cyber threat is successful. Prematurely retiring these plants would be detrimental to our fuel security. This alone, is reason enough to invoke emergency measures. Second, the wholesale electricity markets are broken and have failed to mitigate the market distorting effects of tax subsidies and renewable fuel mandates implemented by states. Finally, it is the proper role of the Secretary of Energy to implement lawful policies to protect our grid and to protect the economic wellbeing of all Americans.

America faces a national security threat of a cyber-attack focused on our electric generation industry and energy delivery systems. Two years ago, our office hosted a cyber security seminar in Fairmont, WV. One industry expert who spoke was Joe McClelland who is FERC's cyber security expert. In subsequent meetings with my staff, Mr. McClelland discussed unclassified information about ongoing cyber-attacks on our pipelines.

Just last week an article outlines recent attacks on energy infrastructure. Additionally, "last month, investigators at the Department of Homeland Security and FBI warned energy companies of a year's long Russian hacking campaign that also targeted firms in the nuclear" industry. Pipeline compressor stations are prime targets. A successful attack on one compressor station can affect several natural gas power plants and grid reliability and resilience. Out of an abundance of caution, Secretary Perry should use 202c in *his judgment to best meet this immediate emergency and serve the public interest*. Prematurely retiring coal and nuclear plants would be detrimental to our fuel security needs.

In testimony before this committee we also heard from industry and government experts on the national security aspects of our nuclear power industry. A strong commercial nuclear industry is critical. Three nuclear industry components are intertwined with each other. The United States' nuclear weapons program, the Navy's nuclear propulsion program and reactors, and the nation's commercial nuclear industry. We heard from one witness who said, "The ability of the US to lead in nuclear safety, security and nonproliferation efforts is significantly lessened as commercial activity erodes".

Finally, in a March 2018 CRS Report on physical grid security, they state, "it has not necessarily reached the level of physical security needed based on the sector's own assessments of risk. Bulk power physical security remains a work in progress."

The wholesale electricity markets are broken and have failed to mitigate the market distorting effects of tax subsidies and renewable fuel mandates implemented by states. Dozens of witnesses have testified, hundreds of studies and millions of articles have been written about the market distorting features of our tax code. We have also heard from the ISO's and RTO's saying, "the markets are working", while ignoring the impact of these subsidies and tax policies have on the wholesale electricity market. It seems the only competition that is relevant in their minds is natural gas versus coal, the playing field is not level.

Just this week before our Committee FERC Chairman McIntyre said we do not have a free market and state policies have distorted pricing.

On a per-megawatt-hour basis, in FY 2013 solar received \$231 of support and wind received \$35, while natural gas and petroleum received 67 *cents* and coal received 57 *cents*, a factor of 405 times to one! And we are to believe this is a fair market? From a witness before this committee, *"Artificially promoting the development of wind and solar actually raises the true cost of electricity generation, because it is currently much cheaper to produce electricity (all things considered) through coal and natural gas plants, rather than new wind and solar"*.

PJM acknowledged the short comings of their market and the distorting effects of subsidies by filing with FERC a plan to properly compensate base load power generators for the value they provide to the market. "Left unaddressed the subsidies will crowd out efficient, competitive resources.... we seek the appropriate balance that respects state policy while avoiding policy impacts of a state's subsidies on the market as a whole and on other states."

Critics say that invoking 202c is a bailout for the coal industry. This is not correct. The reason coal is at an economic disadvantage is due to conscious policy decisions made by Congress and state legislatures around the country. These politicians have distorted the market to such an extent that secretary Perry correctly stated, "We don't have a free market in that industry and I'm not sure you want one." Temporarily invoking 202c will give the markets and regulators the time needed to correct their policy decisions. A policy where all fuel sources are treated fairly and valued for the security they bring is the outcome we seek.

It is the proper role of the Secretary of Energy and President Trump to implement lawful policies to protect our grid and to protect the economic wellbeing of all Americans. Congress also has a role in asking for policies to be implemented. In this regard, 23 members of Congress signed a bipartisan letter to President Trump asking that 202c be invoked. A second bipartisan letter with four additional members of the House "urge immediate action" by the President to keep Ohio's only two nuclear plants open.

In a time where it is the policy of this administration to achieve energy dominance, Americans had to worry about their lights staying on during the recent Cyclone Bomb weather event. In addition, American's had to import Russian LNG just to make sure they remained warm during a

relatively minor weather event. We were put into this situation by the shortsighted policies by New England politicians. What happens the next time?

In January of this year, ISO New England published a report detailing the crisis they face.

- ***Fuel-security risk—the possibility that power plants won't have or be able to get the fuel they need to run, particularly in winter—is the foremost challenge to a reliable power grid in New England.***
- ***The region is vulnerable to the season-long outage of any of several major energy facilities***

ISO-New England recently asked FERC to keep Exelon's Mystic Generating station online, saying their retirement could put electricity reliability at risk. The early retirement of units 8 and 9 at the plant would pose an "unacceptable fuel security risk to the region during the winter months," ISO-NE said in a memo. We cannot agree more. The same should be done nationwide.

The shortsighted renewable policies implemented by some states has led to 73 gigawatts of electricity being imported from Canada, equivalent of 70-120 power plants. Each of the power plants replaced by the Canadian power were an economic driver in their communities. Each plant provided essential tax revenue to support the local government and services. In my state, one such plant provides 30% of the local tax revenue. If this plant is closed due to unfair competition and bad policy decisions made on the national level, it will threaten hundreds of West Virginian's economic security.

Conclusion

I urge you to exercise the powers granted to you via section 202c for a temporary two-year period. This will allow the markets and policy makers the time needed to come up with a correct and fair solution addressing national security and past bad policy. Once we prematurely retire nuclear and coal fired plants we potentially put our economy in jeopardy. Once a plant closes it will not come back. A time out during this rapidly changing time, is a wise thing to do.

We have been warned about potential problems on the immediate horizon, but because of our polarizing politics our institutions have been unable to respond to the challenge. There were those who said the Titanic was unsinkable, experts after the fact said we were not creative enough to imagine 911, now we should not foolishly put our grid at risk. Please invoke 202c to help all Americans.

Sincerely,

David B. McKinley, P.E.
Member of Congress

To: AskOE
Subject: Federal Power Act 202(c)
Date: Thursday, April 19, 2018 2:27:38 PM
Attachments: [IBEW LU 246 comments to FERC.pdf](#)

Dear Members of the Committee:

I have attached my previous comment letter of October 16, 2017 concerning base load generation to support the resiliency of the nations power grid.

I would like to reiterate my request to support the continued operation and financial support of the existing operating coal and nuclear power generation facilities. Should this unprecedented period of low gas prices disappear within the next decade the security of our nation and the financial security of our homes and communities will face irreparable harm should one industry have a monopoly on our power supply. What will we, the consumer, do when this occurs?

Thank you for your consideration of these comments and I urge you to issue an emergency order pursuant to the Federal Power Act Section 202(c) before it is too late to save our base load reserve.

Very sincerely yours,

Kyle N. Brown

Re: Grid Resiliency Pricing Rule
FERC Docket No. RM18-1-000

COMMENTS OF THE INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS, LOCAL UNION 246 (IBEW LU 246) IN SUPPORT OF THE PROPOSED RESILIENCY RULE

On September 28, 2017, the Department of Energy ("DOE") issued the "Grid Resiliency Pricing Rule" (the "Proposal") directing the Federal Energy Regulatory Commission ("FERC") to adopt a rule requiring operators of organized markets to "ensure that certain reliability and resiliency attributes of electric generation sources are fully valued." Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations in Ohio will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the region.

IBEW LU 246 strongly supports the Proposal and shares the Secretary's urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members' loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of

crucial power plants needed for reliability for some time. FERC has the requisite basis to act now. There is no time for delay. In addition to acting promptly, FERC should also direct organized market operators to issue a comprehensive and enduring set of rules, based on the regulatory language of the Proposal, for the proper compensation of critical power plants. Protracted proceedings undertaken by organized market operators that fail to develop fair, compensatory and transparent rules will only engender market uncertainty and delay in providing sufficient compensation to these facilities, thereby jeopardizing the operation of the very plants that the DOE seeks to maintain in operation.

I. COMMUNICATIONS

All communications, correspondence, and documents related to this proceeding should be directed to the following person:

union@ibew246.com

II. DESCRIPTION OF IBEW Local 246

We are a labor organization, representing over two hundred and fifty skilled electricians and their families in the Upper Ohio Valley.

III. DESCRIPTION OF IBEW LU 246'S INTEREST IN PROCEEDING

IBEW LU 246 is a party to a collective bargaining agreement with the National Electrical Contractors Association, Steubenville Division, who service baseload coal and nuclear power plants located in Ohio and West Virginia. Our members work on major infrastructure and industrial development projects that are dependent on the continued operation of the baseload coal and nuclear power plants. As a result, the wages, terms and conditions of employment of its members may be directly affected by the actions taken by the FERC and operators of organized markets in

this proceeding. Thus, IBEW LU 246 members have a direct and substantial interest in this proceeding. As well, the unique perspective of IBEW LU 246 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in Ohio electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across Ohio. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in Ohio provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to IBEW LU 246 members. The First Energy, W.H. Sammis Plant and the American Electric Power, Cardinal Plant directly employs approximately one thousand people, and the maintenance and capital improvement work on these plants supports the local economy by creating well-paying union jobs. In addition, the plants contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. IBEW LU 246 provides over one hundred construction and maintenance workers servicing these facilities. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive

economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed, reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled Electricians, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

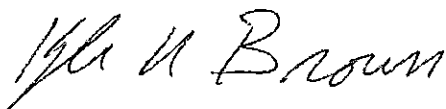

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in Ohio, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, IBEW LU 246 strongly urges FERC to adopt the rule proposed by the DOE as promptly and

comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by the comments considered in this proceeding. FERC has thoroughly considered the impact of electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of pre-mature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory, but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Respectfully submitted,

A handwritten signature in black ink, reading "Kyle N. Brown". The signature is written in a cursive, flowing style.

**BEFORE
THE UNITED STATES DEPARTMENT OF ENERGY**

REQUEST OF FIRSTENERGY SOLUTIONS)	
CORPORATION FOR EMERGENCY ORDER)	DOCKET NO. EO-18-
PURSUANT TO FEDERAL POWER ACT)	
SECTION 202(C) SUBMITTED MARCH 29,)	
2018)	

**COMMENTS OF MURRAY ENERGY CORPORATION IN
SUPPORT OF REQUEST FOR EMERGENCY ORDER AND MOTION TO
INTERVENE**

I. STATEMENT OF SUPPORT

On March 29, 2018, FirstEnergy Solutions Corporation (“FirstEnergy Solutions”), on behalf of its named subsidiaries, requested that the Secretary of Energy (“Secretary”) find that an emergency condition exists in the footprint of the PJM Interconnection L.L.C. (“PJM”) which requires immediate intervention by the Secretary in the form of a Section 202(c) emergency order. The request is made pursuant to Section 202(c) of the Federal Power Act (“FPA”), 16 U.S.C. §824a(c), Section 301(b) of the Department of Energy (“DOE”) Organization Act, 42 U.S.C. §7151(b), and certain of DOE’s Rules of Practice and Procedure, 10 CFR §§205.370-205.373. FirstEnergy Solutions requests a Section 202(c) emergency order directing: “(a) certain existing nuclear and coal-fired generators in PJM, as detailed herein, to enter into contracts and all necessary arrangements with PJM, on a plant-by-plant basis, to generate, deliver, interchange, and transmit electric energy, capacity, and ancillary services as needed to maintain the stability of the electric grid and (b) PJM to promptly compensate at-risk merchant nuclear and coal-fired power plants for the full benefits they provide to energy markets and the public at large, including fuel security and diversity, as detailed herein.”

Murray Energy Corporation (“Murray Energy”) is the largest underground coal mining company in the United States and the largest employer of coal workers in the United States in the underground mining industry, with over 5,600 employees. Murray Energy and its subsidiary companies currently operate fifteen (15) coal mines, consisting of eleven (11) underground longwall mining systems and forty-six (46) continuous mining units in Ohio, Illinois, Kentucky, Utah and West Virginia. Murray Energy produces approximately 75 million tons of bituminous coal each year. It supplies coal to many of the largest coal-fired utility generating facilities in the U.S., and specifically within the PJM footprint. Notably, Murray Energy supplies coal for use in electricity production at FirstEnergy Solutions’ W. H. Sammis and Bruce Mansfield plants.

Murray Energy strongly and enthusiastically supports FirstEnergy Solutions’ request for a Section 202(c) emergency order. FirstEnergy Solutions’ March 29, 2018 request makes a compelling and well-documented case for the emergency order. The relief requested is within the Secretary’s legal authority under Section 202(c) and is justified under the dire and extreme circumstances that threaten the continued viability of baseload, coal fired generation in the PJM footprint, the safety and reliability and economics of the PJM regional grid and the Nation’s vast coal resources in the Midwest.

To the extent appropriate, Murray Energy also moves to intervene in this matter.

II. MURRAY ENERGY’S VITAL INTEREST IN THIS ACTION

President Trump has vowed to preserve coal jobs and low-cost, reliable and fuel source electricity for all Americans, including retirees on fixed incomes, single mothers, and manufacturers who depend on low-cost electricity to produce their products. On March 28, 2017, President Trump issued his Energy Independence Executive Order 13783 which affirms the “national interest to provide clean and safe development of our Nation’s vast energy

resources, while at the same time avoiding regulatory burdens that unnecessarily encumber energy production, constrain economic growth, and prevent job creation.” Executive Order 13783, Section 1(a). Executive Order 13783 specifically directed the U.S. EPA to review and initiate reconsideration proceedings to “suspend, revise, or rescind” the Obama Clean Power Plan as appropriate and consistent with law.” *Id.*, Section 4(a) – (c). In response, the U.S. EPA has proposed the repeal of the Obama Clean Power Plan in Docket No. EPA-HQ-OAR-2017-0355. Murray Energy supports the U.S. EPA action as a necessary and well-deserved first step to protect and preserve coal-fired, baseload generation and to promote the national interest in the Nation’s vast coal resources.

However, the U.S. EPA’s first step in Docket No. EPA-HQ-OAR-2017-0355 to repeal the Obama Clean Power Plan will go for naught unless federal agencies take a concerted, coordinated and aggressive course of action to protect and preserve the Nation’s valuable coal-fired and nuclear generation capacity, including most notably that within the Midwest and the PJM grid, a regional grid that serves a significant proportion of the Nation’s industrial, commercial, residential and national defense electricity consumers that depend upon a safe, reliable, and economic source of electricity generation.

Murray Energy has a vital interest in FirstEnergy Solutions’ request for an emergency order under Section 202. Murray Energy was established in 1988 when Mr. Robert E. Murray mortgaged virtually everything he owned and purchased a single coal mine in Southern Ohio. Thirty years later, Murray Energy is the largest underground coal mining company in the U.S. As stated, Murray Energy is the largest employer of coal workers in the United States in the underground mining industry, with over 5,600 employees. Murray Energy and its subsidiary companies currently operate fifteen (15) coal mines, consisting of eleven (11) underground

longwall mining systems and forty-six (46) continuous mining units in Ohio, Illinois, Kentucky, Utah, and West Virginia. Murray Energy produces approximately 75 million tons of bituminous coal each year and supplies coal to many of the largest coal-fired electric utility generating facilities in the United States.

Murray Energy is also engaged in related business operations and activities, including owning and operating four (4) mining equipment manufacturing and rebuild facilities along with a number of river, truck and rail terminals, and twenty-five (25) river towboats and over 500 coal barges on the inland waterway system. Many of Murray Energy's mining complexes are strategically located near its customers' electric generating stations, and all have excellent, low cost transportation infrastructures to Murray Energy's markets. The vast majority of the coal produced from Murray Energy's mines in the U.S. is used for the generation of electricity. Murray Energy is dependent on the continuing viability and operation of coal-fired generation in the United States.

Murray Energy specifically supplies coal to FirstEnergy Solutions' W.H. Sammis and Bruce Mansfield plants and Allegheny Energy Supply Company's Pleasants Power Station. Murray Energy is under contract to provide 6,500,000 tons of coal per year to the W.H. Sammis and Bruce Mansfield plants through 2028¹. Murray Energy is also under contract to provide 250,000 tons of coal to the Pleasants Power Station in 2018.

Given the current threats to coal-fired generation, Murray Energy, along with other coal producers and related industries, and numerous generating companies and electric utilities, are threatened with bankruptcy and significant economic harm if coal-fired capacity is forced out of the market and prematurely closed. Under the Obama Administration, over 531 coal-fired

¹ Murray Energy received a Notice of Reduction in Generation Capacity from FirstEnergy Generation, LLC dated March 23, 2018 stating that the 2018 tonnage will be reduced from 6,500,000 to 2,200,000 tons.

generating plants, or 59,000 megawatts of generating capacity through 2016, were closed prematurely, many as a result of new and potential regulations that were put into place illegally, without proper cost analysis, and without proven environmental benefits. Further, an additional 12,700 megawatts of coal fired-generation will be closed by the end of 2020, bringing coal's share of electricity to as low as twenty-seven percent (27%). These closures are the functional equivalent of entirely eliminating the combined electricity supplies of Ohio, Pennsylvania, Indiana, and West Virginia. In the PJM footprint alone, which covers all or part of thirteen (13) states and sixty-five (65) million people, 11,000 megawatts of coal-fired electricity generation has been closed over the past four (4) years. In addition, 20,056 megawatts of this baseload capacity in PJM is contemplated for closure.

This devastation has had, and will continue to have, far-reaching consequences for the United States. As well documented by FirstEnergy Solutions, numerous coal-fired and nuclear plants in PJM have announced that they are financially challenged and are closing or contemplating closure. FirstEnergy Solutions itself has now filed for bankruptcy. By early 2016, the total value of the American coal industry had declined from \$68.8 billion five (5) years before to \$4.08 billion, a ninety-four percent (94%) reduction in value. A total of fifty-two (52) coal companies were in bankruptcy proceedings with only four (4) major companies remaining financially solvent. Local rural communities in coal producing regions, and in areas that depend on coal-fired power plants, are losing jobs and millions of dollars in local tax support due to the closure of coal-fired generation plants. This devastates the residents and the employees supporting local businesses, governments, and school districts.

Given the dire and extreme circumstances fully documented in FirstEnergy Solution's March 29, 2018 request for emergency order, it is absolutely imperative that the Secretary immediately issue the requested Section 202 emergency order.

III. THE SECRETARY HAS THE LEGAL AUTHORITY TO ISSUE THE REQUESTED SECTION 202 EMERGENCY ORDER

Pursuant to Section 202(c) of the Federal Power Act (16 U.S.C. §824a (c)), the Secretary of the U.S. Department of Energy has the authority, whenever the Department determines that an “emergency exists by reason of . . . a shortage of electric energy or of facilities for the generation . . . of electric energy . . . ,” to issue an emergency order to prevent an electric generation plant from shutting down:

(c) Temporary connection and exchange of facilities during emergency

1) During the continuance of any war in which the United States is engaged, or whenever the Commission determines that *an emergency exists by reason of* a sudden increase in demand for electric energy, or *a shortage* of electric energy or *of facilities for the generation* or transmission *of electric energy*, or of fuel or water for generating facilities, or other causes, *the Commission shall have authority*, either upon its own motion or upon complaint, with or without notice, hearing, or report, *to require by order such temporary* connections of facilities and such *generation*, delivery, interchange, or transmission *of electric energy* is in its judgment will best meet the emergency and serve the public interest. If the parties affected by such order fail to agree upon the terms of any arrangement between them in carrying out such order, the Commission, after hearing held either before or after such order takes effect, may prescribe by supplemental order such terms as it finds to be just and reasonable, including the compensation or reimbursement which should be paid to or by any such party. (emphasis added).

The Secretary's authority and discretion under Section 202(c) is very broad and the duration for action is not limited. Section 202(c) empowers the Secretary to act “whenever [he] determines that an emergency exists by reason of “certain specified market conditions or other

causes” to order actions “as in [his] judgment will best meet the emergency and serve the public interest.” 16 U.S.C. §824a (c)(1).

DOE’s regulations define emergency broadly, stating that an emergency “can result from a sudden increase in customer demand, an inability to obtain adequate amounts of the necessary fuels to generate electricity, or a regulatory order which prohibits the use of certain electric power supply facilities. 10 CFR §205.371, defines “emergency” and provides:

§ 205.371 Definition of emergency. (“Emergency,” as used herein, is defined as an unexpected inadequate supply of electric energy which may result from the unexpected outage or breakdown of facilities for the generation, transmission or distribution of electric power. Such events may be the result of weather conditions, acts of God, or unforeseen occurrences not reasonably within the power of the affected “entity” to prevent. An emergency also can result from a sudden increase in customer demand, an inability to obtain adequate amounts of the necessary fuels to generate electricity, or a regulatory action which prohibits the use of certain electric power supply facilities. Actions under this authority are envisioned as meeting a specific inadequate power supply situation. Extended periods of insufficient power supply as a result of inadequate planning or the failure to construct necessary facilities can result in an emergency as contemplated in these regulations. In such cases, the impacted “entity” will be expected to make firm arrangements to resolve the problem until new facilities become available, so that a continuing emergency order is not needed. Situations where a shortage of electric energy is projected due solely to the failure of parties to agree to terms, conditions or other economic factors relating to service, generally will not be considered as emergencies unless the inability to supply electric service is imminent. Where an electricity outage or service inadequacy qualifies for a section 202(c) order, contractual difficulties alone will not be sufficient to preclude the issuance of an emergency order.)

Section 205.373 specifies the information required to be submitted. FirstEnergy Solutions has more than adequately addressed these requirements at pages 27-31 of the March 29, 2018 request.

IV. FIRSTENERGY SOLUTIONS HAS FIRMLY ESTABLISHED THAT AN EMERGENCY EXISTS UNDER SECTION 202 DUE TO THE RECENT AND IMMINENT CRITICAL REDUCTION IN NUCLEAR AND COAL-FIRED GENERATION CAPACITY

It is imperative that the Secretary act expeditiously to grant the relief requested by FirstEnergy Solutions to ensure continued operation of a secure and diverse electric generation fleet to secure reliable, efficient and cost-effective supplies of electricity in the PJM footprint.

This action is one of the most important actions presented to the Secretary for his consideration. During the past six years, close to 58,000 MW of highly dependable baseload generating capacity with stable cost structures and on-site fuel supply have been retired. Most of these generating units burned coal, but almost 5,000 MW of nuclear capacity also have been shut down. Prior to retirement, these generating units accounted for eighteen percent (18%) of total baseload generating capacity in the United States, routinely generating 2,555,000 GWh of electricity per year. The replacement cost for this generation is more than \$100 billion. Approximately another 30,000 MW are currently scheduled to be retired. Despite this fact, neither FERC nor PJM have ever systematically examined in depth the impact of these retirements on grid resilience, the vulnerability to severe price spikes, or the ability to keep electricity costs at reasonable levels on a long-term basis.

A. Continued Operation of American's Coal-Fired Electricity Generation Fleet in the PJM Grid is Absolutely Vital to Ensuring Reliable, Efficient and Cost-Effective Supplies of Electricity to the Region

America enjoys an abundant resource of proven coal reserves. Coal is a critical component of America's energy resources and continued operation of America's coal-fired

electricity generation fleet in the PJM grid is absolutely vital to ensuring reliable, efficient and cost-effective supplies of electricity to the region.

For over a century, coal-fired generation has been the safe, reliable, low-cost, and fuel-secure source of electricity in America, providing the baseload generation, as well as the capacity, reserve, and ancillary services that are absolutely necessary to maintain the integrity and reliability of our Nation's power grids. The historical fleet of coal-fired generating units, particularly in the Midwest, has served the economy well, providing as much as eighty to ninety percent (80 - 90%) of in-state generation in many states over the years. Coal-fired generation has also served the commercial, manufacturing and industrial sectors of this Country, providing low-cost, reliable, high capacity and peak demand services that are absolutely necessary for American manufacturers to operate and to compete in the global marketplace.

Over the years, coal-fired generation has been less susceptible than other sources to both short-term and long-term fuel price variation and supply. Coal-fired generation has been the constant through the years of the Arab oil embargo, the natural gas shortages of the 1970's and 1980's, the ensuing volatility in natural gas prices thereafter, nuclear power regulatory challenges, and extreme weather conditions, most recently the 2014 Polar Vortex and 2018 Bomb Cyclones.

There is no better illustration of the need to protect baseload generation than the so-called "Bomb Cyclone," which immersed the eastern United States in extremely cold, windy conditions from December 27, 2017 through January 8, 2018. Notwithstanding that this cold snap occurred primarily over the holidays, at least two (2) million Americans lost their power, and, tragically, twenty-two (22) people lost their lives. Without the electricity provided by our coal-fired and

nuclear power plants, the devastation of this very short twelve (12) day Bomb Cyclone would have been far worse.

The United States Department of Energy's National Energy Technology Laboratory recently issued a report ("Government Study") analyzing the reliability and resiliency of different sources of electricity generation during the Bomb Cyclone. The Government Study confirmed what many of us have already known, that coal was the single most reliable and resilient form of electricity production during that critical time. Coal and nuclear power provided eighty-nine percent (89%) of the electricity during this Bomb Cyclone. During this time coal-fired generation averaged an output level of 46,038 megawatts, over fifty percent (50%) greater than the average of 29,849 megawatts. Indeed, if it were not for the electricity generated by our Nation's coal-fired power plants, with ample capacity and on-site fuel availability, the grids would have experienced a massive nine (9) to eighteen (18) gigawatts of shortfall, leading to system collapse.

During this cold snap, coal far outperformed all other fuel sources, particularly natural gas and renewables. At least 37,000 megawatts of supposedly available natural gas-powered electricity was entirely unavailable due to the priority for home heating use and frozen natural gas pipelines. Where natural gas was available, prices peaked at over \$95 per million BTU in the PJM, and over \$175 per million BTU in New York City, which is sixty (60) times the normal cost. Also, during this time, the cost of electric power from natural gas-fired plants peaked at over \$500 per megawatt hour, compared to a predominant rate of about \$28 per megawatt hour. The ISO New England regional transmission organization has confirmed that their region is at major risk of fuel insecurity and it currently has no defined solution, due to New England's

dependence on natural gas relying on ‘just in time’ delivery and the retirement of coal and nuclear generating capacity with 70-80 day supply of coal stored in stockpiles on site.

Similarly, wind turbines and solar panels contributed virtually nothing to our Country’s electricity needs at that dire time, as cloud cover and wind speeds caused these resources to be unable to dispatch. The Government Study concluded that wind energy was down twelve-percent (12%) across the eastern United States. When considered together, wind and solar electricity generation declined nineteen percent (19%) in Midcontinent Independent System Operator (“MISO”), twenty-nine percent (29%) in Southwest Power Pool (“SPP”) and thirty-two percent (32%) in Electric Reliability Council of Texas (“ERCOT”). Fortunately, coal-fired electricity was able to step up and to fill the void for seventy-four percent (74%) of this incremental lost generation.

The Government Study valued the resilience provided by coal at \$3.5 billion in the PJM market alone, which equates to \$288 million per day. PJM’s President and CEO, Mr. Andrew Ott, recently stated that 1,410 megawatts of nuclear capacity and 3,688 megawatts of coal-fired capacity that operated during the recent cold snap in the eastern United States are scheduled to be deactivated within the next five (5) years.

These problems from the recent cold snap were not an isolated incident. During the so-called “Polar Vortex” of early 2014, PJM came within 500 megawatts of a major system disruption on a demand of 140,000 megawatts. A total of 9,300 megawatts of supposedly available natural gas-fired generation was not available due to gas supply disruptions to the generators. Further, the cost of producing electricity in the Midwest and Mid-Atlantic area rose above \$1,000 per megawatt-hour for the first time in American history.

During this time, an Ohio-based electric power company was ordered by the State's Public Utility Commission to be connected to 3,800 megawatts of wind and solar power. Only fifteen (15) megawatts of the 3,800 megawatts were available during the crisis. What the utility relied on during the cold snap was 8,170 megawatts of coal-fired generation. As all 8,170 megawatts have been closed, what will happen next time?

The recent Bomb Cyclone and 2014 Polar Vortex demonstrate that our electric power grids are not as resilient and reliable as the independent power grid operators, some electric utilities, and the Federal Energy Regulatory Commission ("FERC") claim. Indeed, we have a power grid reliability and resiliency crisis in much of America. But, will a system collapse occur before they recognize and do something about it?

During the 2018 Bomb Cyclone, the consequence of lack of fuel diversity was seen in New England ISO ("NE ISO") pricing. Comparing the first half of January 2018 to the first half of January 2017, natural gas prices (Algonquin hub) were up from an average of \$5.60 per MMBtu in 2017 to \$22.78 per MMBtu in 2018, a 307 percent increase. Power prices (Mass Hub) were up from an average of \$41.80 per megawatt-hour to \$147.74 per megawatt-hour, a 253 percent increase. Also relevant was the over 7000 percent increase in use of oil for power generation as a result of supply constraints on natural gas due to the lack of storage and pipeline capacity. Dual fuel gas and oil plants had to switch to oil to meet load. Pricing was also up in PJM West, which had an average energy price of \$119.53 per megawatt-hour in the first half of January 2018. The average energy price and price increases were higher in NE ISO than PJM West because the coal generation in PJM increased by about 10 percent in the first half of January 2018 which significantly reduced the increased generation required from oil. There is

no question that had it not been for the coal capacity in PJM, MISO and elsewhere the power prices would have been significantly higher.

As addressed by FirstEnergy Solutions, numerous baseload plants in PJM have announced that they are financially challenged and are closing or contemplating closure. If action is not immediately taken, thousands of additional megawatts of reliable baseload capacity will retire leaving PJM without fuel-secure baseload resources. These closures include:

- FirstEnergy Solutions, which through Applicants indirectly owns 12,300 MW of generation, has now filed for bankruptcy. Multiple plants are at risk for permanent closure as a result of this expected action.
- FirstEnergy Solutions submitted notices to PJM on March 28, 2018, that it would deactivate its three nuclear plants, Davis-Besse (908MW), Perry (1,268 MW), and Beaver Valley (1,872 MW), by 2021.
- FirstEnergy Corp. announced that Units 5-7 at the W.H. Sammis coal-fired plant (1,490 MW) are in danger of being closed. The company previously announced that Units 1-4 (720 MW) will close by May 2020.
- FirstEnergy Corp. has announced that the 2,510 MW Bruce Mansfield coal-fired plant is at risk of closure due to the exposure to changing market conditions.
- Allegheny Energy Supply Company, LLC, a FirstEnergy Corp. subsidiary, recently submitted a deactivation notice for Pleasants Power Station, a 1,300 MW coal-fired plant in West Virginia.
- Dayton Power & Light has announced the closure by June 2018 of the J.M. Stuart coal-fired plant (2,318 MW) and the Killen Station Unit 2 coal-fired plant (600 MW), citing market conditions making the plants not economically viable. Stuart Unit 1 was closed even earlier, on September 30, 2017.
- Owners of the 1,884 MW Homer City coal-fired power plant attempted to sell the plant in 2016, but were unable to find a buyer; Standard & Poor's analysts cite lower power prices and increasing expenses as driving forces behind the facility's ills.
- Westmoreland Partners recently announced the sale or closure of the 209 MW Roanoke Valley coal-fired power plant. As anticipated, on March 1, 2017, these units retired.

- Exelon has announced that it will close the Oyster Creek nuclear plant (608 MW) in October 2018 – a decade before the end of its operating license – citing negative economic factors.
- Exelon has announced the premature closure of the 837 MW Three Mile Island nuclear power plant in September 2018, citing deteriorating economic value.

(March 29, 2018 Request, pp. 20-22)

Renewable energy sources are not a viable or credible alternative to baseload coal-fired generation. Wind and solar generation sources are intermittent and unreliable and therefore cannot be relied upon to meet peak or base load demand. Without the price support provided by the Wind Production Tax Credit, wind generation will be a high cost resource. Natural gas-fired generation is not the answer either, as gas pricing is volatile and gas supply is unreliable given limited gas storage capacity, pipeline limitations and a requirement to meet residential and commercial customer requirements ahead of power generation.

As asserted by FirstEnergy Solutions, PJM itself has recognized the need for resiliency.

Fuel diversity and resiliency are key components of a resilient grid.

PJM itself has recognized the need for resiliency, finding that, “[i]n addition to delivering energy services reliably during strained system conditions, to which probabilities can be attached, e.g., plant outages, weather variability), a resilient energy system also must be resistant to larger scale shocks to which it is difficult to attach probabilities . . .” PJM recently concluded that “reliability attributes supplied through generation and other resources . . . support reliability” and “the maintenance or assurance of these attributes into the future are important to resilience mitigation.” Fuel diversity and security are key components of a resilient grid. PJM acknowledged the connection between diversity and resiliency when it committed to “analyz[ing] future trends in resource mix and their impacts on both reliability and resilience.” As PJM’s market monitor stated, “[s]ignificant reliance on specific fuels, including nuclear, coal and gas means that markets are at risk from a significant disruption in any one fuel.” (March 29, 2018 Request p, 23).

NERC also recognizes the critical contributions of nuclear and coal-fired generation to the electric grid. As FirstEnergy Solutions states:

NERC goes further, recognizing not only the importance of fuel diversity in maintaining a resilient energy system, but also the critical contributions of nuclear and coal-fired resources to mitigating risks to the electric grid. Overreliance on natural gas, by contrast, *increases* risk to the electric grid because, as NERC states, “within a relatively short time, a major failure” in the natural gas transmission system “could result in loss of electric generating capacity that could exceed the electric reserves available to compensate for these losses.” As explained by Dr. Henry Chao, Executive Advisor and Vice President at Quanta Technology and former Vice President at New York Independent System Operator (“NYISO”): “Abundant supplies of natural gas provide many advantages to electric consumers, but . . . natural gas delivery systems lack the reliability and redundancy of the bulk electric system. Specifically, there are no systematic reliability criteria for natural gas delivery system planning and operations; whereas the electric power industry has mandatory reliability standards that are developed and enforced by NERC.” (March 29, 2018 Request, p. 23)

Murray Energy fully endorses FirstEnergy Solutions’ conclusion that unless immediate action is taken, the continued retirement of nuclear and coal-fired generating units will invariably lead to increased electric price volatility, lessened grid resiliency and dependability, uncertain electric security, economic instability and job losses. FirstEnergy Solutions states it best:

Unless immediate action is taken, the continued retirement of nuclear and coal-fired generating units – by breeding greater dependence on generation fueled by natural gas, which is subject to supply disruptions, constrained pipeline capacity, a general inability to store fuel on-site, and competing demand for consumer heating in winter months – will increasingly result in significant, negative outcomes for the approximately 65 million people living and working within the PJM footprint. These harmful consequences include increased electric price volatility, lessened grid resilience and dependability, uncertain electric security in the future, decreased economic stability, and severe job losses – especially in the coal sector – as both power plants and fuel suppliers declare bankruptcy and cease operations. Combined, these conditions are potentially disastrous for the electric grid and the economy. PJM itself recently found that as the “resource mix moves in the direction of less coal and nuclear generation, generator reliability attributes of frequency response, reactive capability and fuel assurance decrease . . .” (March 29, 2018 Request, p. 24).

B. At-Risk Merchant Nuclear and Coal-Fired Plans Must Be Compensated For the Benefits of Resiliency and Diversity Provided to the Grid.

FirstEnergy Solutions is absolutely correct in asserting that at-risk merchant nuclear and coal-fired plants must be compensated for the benefits of resiliency and diversity provided to the grid. Neither FERC nor PJM have addressed these important issues. Further delay will continue to devastate the reliability of the grid and cannot be tolerated.

A recent study performed by the leading global economic consulting firm, IHS-Markit concludes that, on a going forward basis (excluding sunk costs), the costs of continuing to operate many recently-retired coal-fired plants is significantly lower than the long-term marginal cost of building new generation.² In some instances, on a properly-calculated apples-to-apples basis, the cost of electricity generated by a newly-constructed power plant may be approximately twice that of a baseload coal or nuclear plant that has recently retired.³

Furthermore, baseload coal and nuclear plants typically operate at high capacity factors and have stable operating costs because fuel can be purchased under long-term contracts with fixed pricing. As such, coal plants are valuable assets which limit exposure to price spikes, keep electricity costs at reasonable levels and historically have been the backbone of the operation of the grid. From an economic standpoint, it seldom should make sense to shut down these generating units, especially since, once shut down, these generating units are permanently lost. Yet that is precisely what is occurring today.⁴

A related problem that will worsen with further retirements of baseload coal and nuclear plants will be the increased frequency, severity, and duration of price spikes that will arise with

² IHS Markit, *Ensuring Resilient and Efficient Electricity Generation: The Value of the current diverse US power supply portfolio*, at p. 8 (Sept. 2017) (hereinafter, "IHS Study").

³ IHS Study at 36.

⁴ Many of the companies that historically have been leaders in electric generation, such as AEP, Duke, NRG and Calpine, have announced that, except for generating units supported by long-term Purchase Power Agreements, they will no longer build new merchant generation and, in several instances, are liquidating their entire merchant generation portfolio. This is reducing the number of experienced players interested in continuing to own and operate generation. In addition, negative energy prices primarily as a result of wind production tax credits are becoming increasingly prevalent, with crushing impacts on every type of base load.

increased dependence upon natural gas. In particular, during the past several years the ability of grid operators to shift back and forth between natural gas-fired generation and coal-fired generation has played an increasingly critical role in managing price volatility. When gas prices rise, coal generation increases; when gas prices fall, coal generation declines. With additional coal plant retirements, however, the ability to reduce gas use by increasing use of coal-fired capacity declines, reducing the amount of available fuel switching by a startling 11 BCF/day in the past six years.⁵ As a result, natural gas price increases are expected as coal generation is not available to cap gas demand and price.

Further, the reduced potential for fuel switching is not the only change that is occurring that could cause adverse volatility and price spikes. LNG exports from the U.S. began in earnest in 2016 with the completion of the Sabine Pass facility which reached 2 billion cubic feet per day (“BCFD”) by year end. Another six plus BCFD of LNG capacity is under construction and 13.5 BCFD of LNG capacity is in advanced development.⁶ As exports of LNG grow, natural gas pricing is expected to increasingly be affected by the global price, thereby increasing volatility and making it even more important to keep existing coal-fired units online in order to maximize the availability of fuel switching.

IHS calculates that retirement to the existing coal and nuclear generation capacity would result in an increase of retail power prices by about 25 percent and net consumer costs by about \$98 billion per year.⁷ Therefore, failure to maintain the resource diversity by prematurely retiring nuclear and coal baseload units could, extrapolating over the next 20 years, increase electricity costs by as much as \$2 trillion. These effects are magnified further as soaring

⁵ ABB, Actual and Projected Coal Capacity Retirements in the United States, 2011-2020, Ventyx Database, October 18, 2017.

⁶ EVA, Quarterly LNG Outlook, December 2017.

⁷ IHS Study at 5, 37-38.

electricity costs ripple through the broad economy, with large adverse impacts over the three year period on U.S. GDP (a loss of 0.8%), on real disposable income (a drop of about \$845 per household in 2016 dollars), and jobs (a loss of 1 million).⁸

Every time additional coal-fired generation is retired, the vulnerability to frequent and severe natural gas and electricity price spikes rises, since the natural gas price increase required to induce sufficient fuel shifting to balance the market continues to increase. As a result, in any winter as cold or colder as the winter of 2013-14, the potential natural gas price increase required to balance the market could be as much as two to three times as great as in the Polar Vortex winter.

It is a bedrock principle of power supply planning and cost-effective risk management that maintaining resource diversity (creating optionality) has significant, tangible economic value. Putting “all of one’s eggs in one basket” seldom makes sense. FERC openly acknowledges, however, that its current rules fail to take this principle into account, turning a blind eye towards this issue. Instead, its rules focus strictly on short-term marginal costs – i.e., day-ahead or same-day energy pricing and capacity payments based upon expected needs three years out.

This rigid focus on short-term marginal costs gives generation owners an incentive to focus only on maximizing short-term operating margins, *not* on maximizing operating efficiency over the seven to twelve year planning horizon required for investments in new baseload generation. The IHS Study highlights the critical importance of this issue. IHS estimates that over the past three years, maintaining a diverse generating mix has saved electricity users an average of \$98 billion/year – i.e., extrapolated out over a twenty (20) year period, potentially as much as \$2 trillion.

⁸ HIS Study at 5, 39.

The recent September 2017 IHS Study shows that a diverse portfolio of generation resources that include baseload coal and nuclear units is necessary to ensure that electricity prices remain at reasonable levels on a long term basis. As articulated in the IHS Study, a cost effective electrical power supply portfolio integrates available generation technologies – intermittent renewables, gas turbine, gas combined cycle, and baseload nuclear and coal – to meet consumer demand at the lowest overall cost. Because fifty percent (50%) of consumer demand is constant, day or night, winter or summer, baseload nuclear and coal plants are the most cost-effective resources to serve this portion of the electrical load.

The figure below from the IHS Study compares the going forward costs for existing coal and nuclear power baseload generation to the cost of replacement of this generation with (1) natural gas-fired combined cycle generation and (2) a mix of intermittent wind and solar resources integrated with natural gas-fired combined cycle generation.⁹

This comparison shows that replacing existing coal and nuclear generation with natural gas and intermittent renewable generation would cost approximately double the cost of the existing coal and nuclear generation. The IHS Study notes that, as a result, the continued

⁹ IHS Study at 36.

retirement of baseload coal and nuclear units could result in significantly eroding consumer net benefits, stating as follows:

The current accelerated turnover of generating resources in the US power supply portfolio is eroding the net benefit to US consumers from electricity consumption. The potential exists for current trends to lead to a less diverse supply portfolio made up of no nuclear, coal, or oil generating resources and 20% less hydro capacity, with the rest of generation made up of wind and solar resources integrated with natural gas-fired generating technologies in proportions reflecting the current mix of these technologies and fuel sources in the new power supply pipeline.¹⁰

IHS calculates that this would result in an increase of retail power prices by about 25 percent and net consumer costs by about \$98 billion per year.¹¹ Therefore, failure to maintain the resource diversity by prematurely retiring nuclear (and coal) baseload units could, extrapolating over the next 20 years, increase electricity costs by as much as \$2 trillion. These effects are magnified further as soaring electricity costs ripple through the broader economy, with large adverse impacts over the three (3) year period on U.S. GDP (a loss of 0.8%), on real disposable income (a drop of about \$845 per household in 2016 dollars), and jobs (a loss of 1 million).¹²

As coal capacity is retired at alarming rates, however, the crucial market balancing will cease to be effective. Many coal units scheduled for closure were called upon to meet the exigent circumstances created by the Polar Vortex. If gas-to-coal switching can no longer moderate demand effectively, prices will have to go high enough to shut-in LNG exports – putting U.S. residential, commercial, and industrial end users at the whim of international markets. End users may be subjected to prices of \$10.00/MMBtu or higher for an extended period of time – more than 3-4 times recent levels. With falling diversification in the electricity

¹⁰ IHS Study at 36.

¹¹ IHS Study at 5, 37-38.

¹² IHS Study at 5, 39.

sector and increasing reliance on natural gas, these increased natural gas costs will flow directly into electricity markets, increasing costs sharply.

Future retirements of coal and nuclear generation will only continue to increase demand for natural gas generation and reduce the ability to switch from gas-to-coal in periods of system stress. Absent immediate action, it is entirely plausible that within the next decade an additional 20-25% of coal and nuclear capacity may be retired. This will lead to additional employment loss and will further increase vulnerability of the grid to natural gas price shocks, while at the same time making these shocks significantly more likely by reducing the ability to switch from gas-to-coal during periods of high system stress. Even if these obstacles could be overcome, there will likely be a significantly increased fuel cost for natural gas generators and, by extension, higher prices for electricity.

FirstEnergy Solutions is entirely correct in contending that neither FERC nor PJM have addressed distorted market pricing conditions. Market rates not recognizing the benefit of resiliency and diversity are putting the Nation at risk for astronomical cost increases in the future. Neither FERC nor PJM have addressed the wave of recent and contemplated plant retirements. There has been no effort to address:

- The impact of continued retirement of baseload units on the ability of grid operators to meet voltage support and frequency control requirements or to provide reactive power;
- As detailed above, the potential cost-effectiveness of continuing to operate these plants, compared to the expected cost of new generation that might soon be needed in the regions in which retirements have been occurring;
- The potential long-term costs and price risks for electricity customers of failing to maintain resource diversity; and
- The ability to cost-effectively meet future state or federal environmental requirements that have a significant possibility of occurring within the next 5 to 10 years, if not sooner.

In sum, neither FERC nor PJM have acted to ensure adequacy of service and protect electricity users against long-term wholesale electricity prices that are higher than necessary in a number of specific respects. By failing to properly account for the value of baseload coal and nuclear generation, FERC and PJM have virtually ignored the role of resource diversity as it relates to potential outages, as well as the agencies' key role in maintaining wholesale power rates at just and reasonable levels and ensuring the safety, reliability and dependability of the Nation's electric supply system.

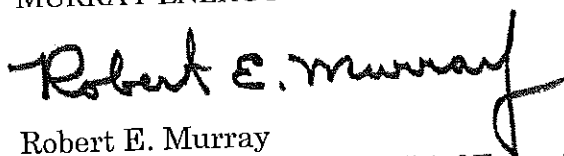

V. CONCLUSION

FirstEnergy Solutions' March 29, 2018 Request For Emergency Relief Under Section 202 is well-supported, justified and should be immediately granted.

On behalf of Murray Energy, and its ownership, management, and employees, we respectfully submit these comments.

Sincerely,

MURRAY ENERGY CORPORATION

From: Joseph Talnagi
To: [AskOE](#)
Subject: Assistance for FirstEnergy
Date: Thursday, April 19, 2018 3:47:19 PM

Assistance should be provided to FirstEnergy Corporation to support continued operation of their base load supply capacity, especially for the Davis-Besse, Perry, and Beaver Valley facilities. Nuclear energy generation is the most economical and expeditious approach to providing reliable base load supply while reducing carbon emissions, which surely would increase if the zero-emission nuclear facilities were to be replaced with natural gas-fired capacity. These facilities represent valuable national infrastructure which must be preserved if our nation is to retain the security of a reliable electricity supply. Power grid instability will result if reliable, high capacity-factor facilities such as these were lost.

I must emphasize that any such assistance should not be labeled as a "bail-out". Rather, it is more correctly viewed as a reasonable valuation of the zero-emissions, high reliability electricity supply. The current market structure does not place a reasonable value on these aspects of nuclear generation, which is grossly unfair since other zero-emissions generators of much lower reliability (e.g., wind turbines and PV solar) receive extremely generous subsidies and preferential treatment in the form of tax breaks and mandated capacity percentages (such as from Renewable Energy Portfolio provisions). Likewise, natural gas facilities are not penalized for their carbon emissions, which are significant, nor are they bearing the full costs of environmental damage caused in the extraction step by the near-universal use of fracking gas wells for enhanced production.

While some argue that these DOE provisions should be reserved for use in "true disasters", it is my opinion that preventing "true disasters" is an equally valid argument for invoking the emergency provisions. Surely loss of a reliable and stable electrical grid would be a disaster of monumental proportions if we throw away valuable generating infrastructure for no valid reason.

Thank you for the opportunity to submit my comments.

Re: Proposed Grid Resiliency Pricing Rule

Ladies & gentlemen:

I am writing on behalf of the labor organizations affiliated with Unions for Jobs & Environmental Progress (UJEP). UJEP affiliates represent some 3.2 million workers from the electric utility, mining, rail, transportation, and construction sectors.

Our affiliates' members have been adversely affected by the ongoing transformation of the electric power sector, and the increasing dependence on renewables and natural gas generation. These workers have lost tens of thousands of jobs as a consequence of the recent closures of mines and electric generating plants due to a number of factors, most importantly lower natural gas prices, compounded by the high compliance costs of recent U.S. EPA emissions regulations.

UJEP is an ad hoc association of labor unions involved in energy production and use, transportation, engineering, and construction. Our members are: International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers Union; International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers; International Brotherhood of Electrical Workers; International Brotherhood of Teamsters; SMART Transportation Division; Transportation • Communications International Union, IAM; United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; United Mine Workers of America, and Utility Workers Union of America. For more information about us, visit www.ujep4jobs.org.

We strongly support the proposed Grid Resilience Pricing Rule as an appropriate and well-supported remedy to correct the failure of current market mechanisms to compensate the resiliency and related benefits provided by fuel-secure baseload power generation. We view the proposed rule as an important first step toward stabilizing the diversity and resilience of the generation fleet in competitive markets, and avoiding further job losses due to the premature closures of large coal and nuclear generating plants.

Preliminary analyses by ICF, Inc., indicate that the rule may cost some \$1 to \$4 billion annually, depending on natural gas prices.¹ This is prudent insurance for the critical national security and natural disaster recovery benefits of a stable and resilient electric supply system. The relatively rapid recovery of electric service in many parts of Texas following Harvey was facilitated by the ongoing operation of large baseload nuclear capacity during and after that extreme weather event, despite the loss of more than 7,000 MW of conventional generation capacity. The availability of fuel-secure baseload coal and nuclear capacity was likewise critical to the ability of the eastern interconnect to withstand the extreme load demands of the Polar Vortex.

Our concerns about the steady erosion of the large coal and nuclear baseload power fleet, and its adverse impacts on resiliency and our members' jobs, were expressed in our May 25th letter to Secretary Perry (see attached copy.) We note in summary here key findings of the May 2017 NERC reliability study cited in our letter:

- Conventional units, such as coal plants, provide frequency support services as a function of their large spinning generators and governor-control settings along with reactive support for voltage control. ... Coal-fired and nuclear generation have the added benefits of high availability rates, low forced outages, and secured on-site fuel. Many months of on-site fuel allow these units to operate in a manner independent of supply chain disruptions. ...
- Fuel diversity provides a fundamental benefit of increased resilience. Without this diversity, the impact of rare events impacting availability of resources on the power system increases, and are more likely the result of a common mode failure impacting multiple generation or transmission facilities (e.g., extreme and prolonged cold weather event lead to freezing generator components, transmission line icing, fuel delivery disruption, etc.) ...
- (N)atural gas generation is fueled using just-in-time transportation and delivery, and therefore, is subject to interruption. Roughly 50 percent of natural gas generation resources are considered interruptible, and in constrained natural gas markets these units are not expected to be served during peak pipeline conditions.²

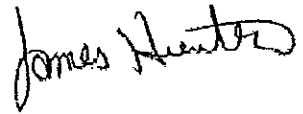

¹ ICF, Inc., Webinar on Proposed FERC NOPR, October 4, 2017, slide 27.

² National Electric Reliability Council, Synopsis of NERC Reliability Assessments - The Changing Resource Mix and the Impacts of Conventional Generation Retirements (May 2017).

We recognize that the proposed rule is on an aggressive timeline, and that many complex design and implementation issues must be resolved during the Commission's deliberations. We encourage the Commission to exercise all due diligence in completing its review and issuance of a final rule in a timely manner.

Thank you for your consideration of our views.

Sincerely,

Re: Baseload Reliability Study

Dear Secretary Perry:

I am writing on behalf of the organizations affiliated with Unions for Jobs & Environmental Progress (UJEP). UJEP affiliates represent some 3.2 million workers from the electric utility, mining, rail, and construction sectors. Our affiliates' members are significantly affected by the ongoing transformation of the electric power sector, and the increasing dependence on renewables and natural gas generation. These workers have lost tens of thousands of jobs as a consequence of the recent closures of mines and coal generating plants due to a number of variables, most importantly a glut of natural gas and lower natural gas prices, compounded by the high compliance costs of U.S. EPA regulations on mercury emissions.

UJEP is an ad hoc association of labor unions involved in energy production and use, transportation, engineering, and construction. Our members are: International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers Union; International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers; International Brotherhood of Electrical Workers; International Brotherhood of Teamsters; SMART Transportation Division; Transportation • Communications International Union, IAM; United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; United Mine Workers of America, and Utility Workers Union of America. For more information about us, visit www.ujep4jobs.org.

We strongly support DOE's plan for a critical examination of electricity markets, which includes reviewing the value of baseload power, and the long-term security and resiliency of the electric grid. Baseload coal and nuclear power plants directly employ more than 154,000 workers, produce major infrastructure projects that put Americans to work, and support a resilient and dependable electric grid.

Baseload power plants have long been the dependable work horses of the electric system, providing energy and ancillary services to customers 24 hours a day, 365 days a year. With significant on-site fuel reserves, they provide the resiliency required to keep electricity flowing under all adverse circumstances. Unlike other energy resources, their operation is not subject to interruption by factors such as extreme weather events or attacks on infrastructure. Our national security, and the economic base of communities across the nation, is dependent on maintaining these plants to support a resilient supply of affordable electricity.

Extreme weather events such as the 2014 polar vortex resulted in a significant amount of gas-fired generation being unavailable due to curtailments of gas supplies and gas infrastructure challenges, threatening the reliability of the grid.¹ Many studies point to increasing frequency of extreme weather events for decades to come that could pose significant risks to the grid.

Numerous baseload power plants have shut down in recent years, and more are expected to close prematurely in the near future. According to EIA, some 40,000 megawatts of coal generation capacity has been shuttered due to the high cost of compliance with EPA's 2012 mercury rule alone.² Once these plants are retired, they are gone for good. Baseload generation is under serious threat from market-distorting subsidies and mandates for non-baseload renewable generation, regulations that target these resources, low natural gas prices, and markets that do not value resiliency and dependability. Further plant closures would contribute to market volatility, result in significant job loss, and discourage industrial development opportunities nationwide. A manufacturing base, and the jobs that go with it, cannot be attracted to return to areas lacking affordable, reliable sources of baseload power.

Jobs by Energy Source

Our coal and nuclear baseload power plants – and the dedicated, skilled workers who operate, maintain, and supply them – are the lifeblood of their communities. They

¹ NERC Polar Vortex Review, (September 2014)
http://www.nerc.com/pa/rrm/January%202014%20Polar%20Vortex%20Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf

² DOE/EIA, Annual Energy Outlook Early Release: Analysis of Two Cases (May 2016) at 27.

provide a strong tax base for essential public services and support more high-paying jobs than other forms of electricity generation (see chart below.) Workers depend on these plants as a basic source of their livelihoods, and their communities, and the country depends on them to support a healthy economy and electricity supply. These workers have been a critical part of this nation's economic backbone.

The reason for the job disparity among generation sources is the complexity and labor intensity of nuclear and coal generating plants, including their operation, maintenance, and fuel supply cycles. Renewable energy supplies are capital intensive, but not labor intensive. The coal and nuclear generation sectors, including their fuel and transportation supply chains, provide the type of high-skill, family-supporting jobs necessary to anchor the economy of the local communities associated with this energy infrastructure.

We recognize that renewable energy creates some jobs. Unfortunately, most of these jobs are only in construction, with much smaller numbers in operation and maintenance. In addition, the overwhelming majority of these jobs do not provide wages and benefits sufficient for building economically healthy middle-class communities. The bulk of solar panel manufacturing is done in China and other developing nations. Rooftop solar installation is done domestically, but is not a source of high-paying, middle-class jobs. Simply because a job is in the renewable sector and considered by many a "green job" does not make it a good paying, family-supporting job.

Ohio Case Study

One example of the economic anchoring effect of baseload power can be found in Adams County, Ohio. Dayton Power & Light (DP&L) has announced its intention to close two coal-fired plants: The J.M. Stuart Station (2,400 MW) and Killen Station (600 MW) together employ upwards of 700 people during normal operations, and in excess of 1,000 during outage events, with an annual payroll of \$80 million. For Adams County, these plant closures would mean the loss of \$8.5 million in tax revenue - equivalent to half of the county's general fund revenue. Schools, hospitals, first responder services, local government, all would be forced to severely curtail services, or even close entirely.

In effect, the entire middle-class economy of Adams County depends on the family-supporting jobs in these stations, and all of the directly associated economic activity including transmission, maintenance, parts and equipment, fuel supply, and fuel transportation. The U.S. Department of Commerce estimates that each job in the Ohio electric generation sector creates 3.54 total direct and indirect jobs.³ Despite having spent \$800 million on emissions equipment in 2006, bringing the stations into full EPA compliance, DP&L is now planning to close the plants and walk away from the local economy, triggering a cascade of economic devastation.

NERC Study Supports Critical Need for Baseload Power

The recent NERC reliability study⁴ submitted to you on May 9th raises numerous cautions about the risks of increased dependence on intermittent generation resources, as well as on natural gas. Current market prices for gas could rise in the future, raising electricity rates absent affordable baseload generation remaining online. Price volatility for natural gas is well documented. We fully concur with NERC's observations about the need for greater attention to the critical role played by conventional coal and nuclear baseload generation:

The rapid changes occurring in the generation resource mix and technologies are altering the operational characteristics of the grid and will challenge system planners and operators to maintain reliability. More specifically:

- Impact of Premature Retirements: Conventional units, such as coal plants, provide frequency support services as a function of their large spinning generators and governor-control settings along with reactive support for voltage control. Power system operators use these services to plan and operate reliably under a variety of system conditions, generally without the

³ U.S. Dept. of Commerce, Bureau of Economic Analysis, RIMS II Direct Effect Jobs Multipliers, Table 3.5 (2014).

⁴ National Electric Reliability Council, Synopsis of NERC Reliability Assessments - The Changing Resource Mix and the Impacts of Conventional Generation Retirements (May 2017).

concern of having too few of these services available. Coal-fired and nuclear generation have the added benefits of high availability rates, low forced outages, and secured on-site fuel. Many months of on-site fuel allow these units to operate in a manner independent of supply chain disruptions.

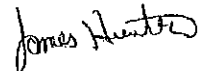

- **Replacement Resource Capability and Characteristics:** As the generation resource mix evolves, the reliability of the electric grid depends on the operating characteristics of the replacement resources. Natural gas-fired units, variable generation, storage, and other resources can provide similar reliability services. However, as a practical matter, costs, market rules, or regulatory requirements (or lack thereof) can affect whether these resources are equipped and available to provide reliability services. To ensure reliability, new generator and load resources must maintain the balance between load and generation, especially during ramping periods. In addition, in some jurisdictions, substantial amounts of generation are now being added “behind the meter” (e.g., roof top solar) and these resources are invisible to system operators. ...

Fuel diversity provides a fundamental benefit of increased resilience. Without this diversity, the impact of rare events impacting availability of resources on the power system increases and are more likely the result of a common-mode failure impacting multiple generation or transmission facilities (e.g., extreme and prolonged cold weather event leads to freezing generator components, transmission line icing, fuel delivery disruption, etc.). **Areas with limited fuel and/or limited resource diversity may be challenged and should increase their attention to resiliency planning**, which requires a strong partnership with state regulators. With natural gas generation primed to continue its growth as the leading choice for new and replacement capacity, important distinctions around fuel security need to be incorporated into reliance and long-term planning at states and with market operators. Mainly, natural gas generation is fueled using just-in-time transportation and delivery, and therefore, is subject to interruption. Roughly 50 percent of natural gas generation resources are considered interruptible, and in constrained natural gas markets these units are not expected to be served during peak pipeline conditions. Many of these plants no longer have the option of burning a liquid fuel. Further, regardless of fuel service arrangements, natural gas generation is subject to curtailment during a force majeure event. (Emphasis in original.)

Unless corrective actions are taken, including new mechanisms that recognize baseload attributes and ensure appropriate compensation for providing the resilience and dependability benefits of baseload coal and nuclear capacity in the electricity marketplace, the long-term viability of these baseload power plants along with the jobs and community economic benefits they bring is in peril.

We encourage the Administration to take prompt and meaningful action to protect baseload coal and nuclear power plants and ensure fuel diversity as the cornerstone of our ability to supply affordable and reliable power to American industry and consumers. Such action is critical to grow our economy and create jobs for the American worker.

Sincerely,

James Hunter
President, UJEP

Re: FirstEnergy Solutions' Request for Emergency Relief under Section 202(c) of the Federal Power Act

Secretary Perry:

Advanced Energy Economy ("AEE") provides the following comments in response to FirstEnergy Solution's ("FE") March 29, 2018 request that the Department of Energy ("DOE") take "emergency" action under Federal Power Act ("FPA") Section 202(c) to direct that certain existing coal and nuclear generators in the PJM Interconnection, L.L.C. ("PJM") region receive extraordinary support, in the form of guaranteed out-of-market compensation.¹

For the reasons discussed below, AEE, on behalf of itself and its members, respectfully urges the Secretary to swiftly reject FE's request. There is no legal basis on which to grant FE's request. Using FPA Section 202(c) in the sweeping manner proposed by FE would be inconsistent with the plain language of the statute, DOE's own regulations, and DOE's prior usage of the statute. Moreover, there is no reliability or resilience emergency in PJM that would justify such unprecedented action, which would upend the operation of the wholesale markets and interfere with established processes for assessing and addressing reliability and resilience concerns.

- **Interests of AEE**

AEE is a national organization of businesses making the energy we use secure, clean, and, affordable. AEE and its state and regional partner organizations, which are active in 27 states across the country, represent more than 100 companies and organizations that span the advanced energy industry and its value chains. Technologies represented include energy efficiency, demand response, natural gas, solar photovoltaics, solar thermal electric, ground-source heat pumps, wind, storage, biofuels, electric vehicles, advanced metering infrastructure, transmission and distribution efficiency, fuel cells, hydro power, nuclear power, combined heat and power, and enabling software. Used together, these technologies and services will create and maintain a higher-performing energy system—one that is reliable and resilient, diverse, cost-effective, and clean—while also improving the availability and quality of customer-facing services. AEE promotes the interests of its members by engaging in policy advocacy at the federal,

¹ AEE reserves the right to supplement these comments and exercise any other rights provided to participants in proceedings under the FPA should DOE open a formal proceeding or otherwise take action on FE's request.

state, and regulatory levels, by convening groups of CEOs to identify and address cross-industry issues, and by conducting targeted outreach to key stakeholder groups and policymakers.

Many of AEE's members either participate directly as competitors in the wholesale electricity markets, including the markets operated by PJM Interconnection, L.L.C. ("PJM"), or are significantly impacted by the outcomes in those markets. AEE is concerned about the impacts that granting FE's request for extraordinary out-of-market cost support would have on the PJM markets and the ability of all energy technologies to compete on a level playing field in those markets. In addition, AEE is troubled by the significant cost increases to ratepayers (including many of AEE's members) that would result from granting FE's request.

- **Motion to Intervene**

AEE does not believe that FE's March 29, 2018 request has become a "proceeding" in which it must intervene and be granted party status to preserve its rights to fully participate under the FPA.² However, out of an abundance of caution, AEE respectfully requests leave to intervene and be granted party status with respect to FE's request. Based on the foregoing statement, AEE submits that it has a significant interest in DOE's resolution of FE's request that cannot be adequately represented by any other party.

- **FE's Requested Use of Section 202(c) Would Be Unlawful, Because There Is No Imminent Reliability or Resilience Emergency Requiring Immediate Action**

The statutory text of Section 202(c), DOE's regulations implementing that text, and relevant judicial precedent all require rejection of FE's request. These authorities all emphasize that the authority granted to DOE by Congress to intervene in the electricity markets to *order* generation resources to produce electric energy – that is, to compel them to operate – is limited to rare instances where an emergency threatens national security or the imminent loss of electricity supply. For example, Section 202(c) itself defines "emergency" narrowly, stating that DOE may exercise its authority to compel production of electricity only in times of "war" or during "sudden" increases in demand or shortages of electricity supply.³ As the D.C. Circuit has explained, this statutory language "speaks of 'temporary' emergencies, epitomized by wartime disturbances, and is aimed at situations in which demand for electricity exceeds supply."⁴ DOE's regulations implementing Section 202(c) similarly define "Emergency" to mean "unexpected . . . events [that] may be the result of weather conditions, acts of God, or unforeseen occurrences not reasonably within the power of the affected 'entity' to prevent."⁵

² For example, DOE has not provided public notice of FE's request, opened notice and comment procedures, or taken any other action on the request. DOE has also stated that its creation of an e-mail repository for comments and materials related to Section 202(c) does not "establish a "docket," and those submitting correspondence do not constitute parties or intervenors to any proceeding." See <https://www.energy.gov/oe/services/electricity-policy-coordination-and-implementation/other-regulatory-efforts/does-use>.

³ 16 U.S.C. § 824(c)(1).

⁴ *Richmond Power & Light v. FERC*, 574 F.2d 610, 615 (D.C. Cir. 1978).

⁵ 10 C.F.R. § 205.371.

There is no emergency in the PJM region that supports taking action under Section 202(c). As PJM and others have demonstrated many times, and as the Federal Energy Regulatory Commission (“FERC”) concluded earlier this year, there are simply no imminent threats to reliability or resilience, nor any sudden increases in demand or decreases in electricity supply anticipated in the PJM region.⁶ The PJM region has more than adequate supply, clearing a 23.9 percent reserve margin in its most recent capacity auction.⁷ DOE’s 2017 “Staff Report to the Secretary on Electricity Markets and Reliability”, in fact, found that the bulk power system is operating reliably and is expected to continue to do so even as the composition of the generation fleet changes.⁸

There is also no severe weather condition, act of God, or unforeseen event impacting the region or FE itself. FE’s request points only to past weather events, all of which were managed effectively with no resulting reliability or resilience emergency.⁹ FE points to a single flawed study claiming that the PJM region would have suffered “interconnect-wide blackouts” if certain coal generation resources had not been available during the recent “Bomb Cyclone” cold weather event.¹⁰ But as PJM and industry analysts have noted, that study fails to recognize that under PJM’s economic dispatch model “PJM dispatched coal units because their costs were lower during certain hours of the cold snap,” not because they provided greater resilience than other availability resources.¹¹ PJM has also provided significant data and analysis to refute the claim that blackouts would have occurred without those coal resources.¹²

FE bases its request primarily on the claim that its coal and nuclear generating assets are not being compensated sufficiently, which is an economic issue. DOE’s regulations, however, state that “economic factors . . . generally will not be considered as emergencies unless the inability to supply electric service is imminent.”¹³ Moreover, the United States Court of Appeals for the District of Columbia Circuit has explained that Section 202(c) is “aimed at situations in which demand for electricity exceeds supply and *not at those in which supply is adequate but a means of fueling its production is in disfavor.*”¹⁴ FE’s request seeks to address financial woes caused by low natural gas prices and the emergence of cost-effective advanced energy technologies that has made its preferred fuel sources less competitive in the wholesale markets. But as Bruce Walker, Assistant Secretary for the Office of Electricity Delivery and

¹² *Id.*

¹³ 10 C.F.R. § 205.371.

¹⁴ *Richmond Power & Light*, 574 F.2d at 615.

Energy Reliability correctly observed, Section 202(c) is “not designed” to “stave [off] an economic issue.”¹⁵

FE has also not identified an “imminent” problem. The retirements projected by FE, if they occur, will happen over the course of several months or even years. For example, several of the generators targeted for special treatment in the FE request have capacity supply obligations in PJM extending at least a year into the future. In addition, PJM has specific processes in place to address the potential reliability impacts from plant closures. Retiring generators must provide notice to PJM, which then studies the potential reliability impacts that could occur. If reliability concerns are identified, PJM can offer full cost of service compensation under a “Reliability Must Run” contract to keep those plants online until solutions to the identified reliability issues can be planned and implemented.¹⁶ This process protects the PJM from most “imminent” reliability threats. Granting FE’s request would inappropriately bypass this established process.

Indeed, in its request FE appears to concede it is asking for assistance that Section 202(c) simply does not contemplate. For example, FE notes that DOE’s implementing regulations do not address the “emergency” that FE has identified,¹⁷ and states that it cannot provide much of the information required by those regulations.¹⁸

- **Granting FE’s Request Would be Inconsistent with DOE’s Prior Use of Section 202(c)**

Granting FE’s request here would be a significant departure from DOE’s past practice. DOE has used its Section 202(c) authority only eight times since 2000. For example, DOE deployed the emergency measure following Hurricane Katrina and Hurricane Ike to ensure that essential services were restored after the devastating storms. Last year, DOE issued two Section 202(c) orders, in both cases to ensure that specific plants were available to meet short-term reliability needs. In one case, continued operation of a single plant was required on a temporary to provide reactive power after severe weather damaged to other plants in the areas, resulting in a short term shortage of reactive power support in the region.¹⁹ In the other, units in PJM were required to run on a short-term basis (approximately six months) to provide specific reliability services needed by PJM until transmission reinforcements could be completed.²⁰

In contrast, FE’s request here would compel the operation of a loosely defined set of coal and nuclear plants on a long-term basis (four years) to address ill-defined threats to “fuel security and diversity,” “energy security and reliability,” and “grid dependability and resiliency.” FE’s request fails to identify any specific generating units that are needed for reliability, or the specific reliability issues that

²⁰ Federal Power Act Section 202(c) – PJM Interconnection & Dominion Energy Virginia, 2017

would result from their imminent closure, as applicants have in all prior cases where DOE has utilized its Section 202(c) authority. For these reasons, DOE should decline to use that authority here.

- **Granting FE's Request Would Threaten to Unravel the Competitive Wholesale Markets that Congress and FERC Have Sought to Foster, And Would Undermine Energy Technology Innovation in Those Markets**

For decades, it has been the policy of Congress and FERC to utilize market-based mechanisms to increase competition in the wholesale power markets and ensure just and reasonable rates as the FPA requires. FERC has, with the approval of Congress, fostered the development of Regional Transmission Organizations and Independent System Operators ("RTOs/ISOs") like PJM, which independently administer markets for wholesale energy and other wholesale electricity products across the country. While these markets are by no means perfect, they have been successful in ensuring reliability and just and reasonable rates while encouraging significant energy technology innovation. The Brattle Group found that PJM's markets have created a more efficient and reliable grid, despite widespread retirements of coal plants. Brattle stated that PJM, despite these retirements, passed that so-called "stress test . . . with no evident threat to reliability."²¹

Competitive markets have allowed for numerous technologies to enhance the reliability and resilience of the grid particularly during times of stress. PJM credited wind and demand response with helping to maintain reliability during the 2014 Polar Vortex, and after the devastating Hurricane Irma in 2017, utilities called upon DR to help maintain grid stability.^{22,23}

Markets also embrace the innovation of advanced energy technologies, which have significant operational and reliability benefits to offer the grid that may be superior to traditional thermal generation, such as the resources in question in FE's request. For example, some advanced energy technologies, such as battery storage, are "instant on," and because of their distributed nature, can immediately provide support to specified areas of the grid in a reliability emergency.

Market-based mechanisms necessarily create winners and losers, which means retirement for inefficient resources. FE's request would interfere with the operation of those mechanisms by providing certain technologies with preferential, cost-based compensation determined outside of those markets. The presence of so many resources with cost-based rates would distort market outcomes and discriminate against other technologies in the marketplace, putting them at a competitive disadvantage, while increasing costs to consumers and denying them the cost-reduction and technology-innovation benefits of robust competition among a variety of suppliers. Propping up resources that can no longer economically

²³ <https://energysmart.enernoc.com/following-hurricane-irma-demand-response-stepped-amid-efforts-restore-power>

compete ultimately harms ratepayers and directly undermines FERC's ability to meet its statutory obligation to ensure just and reasonable rates.

As DOE knows, FERC recently opened a new proceeding to examine long-term resilience in the RTO/ISO markets.²⁴ In the absence of any credible demonstration of an immediate threat to reliability or resilience, FERC should be allowed to continue its exploration of long-term resilience and develop a record that will allow it to find approaches to addressing resilience problems that continue to rely on technology-neutral market-based mechanisms.

Conclusion

For the foregoing reasons, AEE respectfully requests that DOE reject FE's request for action under FPA Section 202(c). Thank you for your attention to these comments.

To whom it may concern,

I am writing on behalf of Senator Capito to express her support for the Department of Energy taking measures to ensure grid resilience and reliability by protecting baseload coal and nuclear assets from distortionary market forces.

I have attached a letter led by the Senator and signed by the West Virginia House delegation to then-FERC Chairman Chatterjee in support of the Secretary's NOPR on the issue and a press release on the same subject.

The Senator has also communicated support for the targeted use of Federal Power Act Section 202c authority in this arena via letter to and conversation with President Trump.

Thanks for your consideration.

Sincerely,

Travis Cone

CAPITO ENCOURAGED BY ENERGY SECRETARY'S ELECTRIC GRID STUDY

WASHINGTON, D.C. — U.S. Senator Shelley Moore Capito (R-W.Va.) today applauded U.S. Department of Energy Secretary Rick Perry's decision to initiate a study of the nation's electric grid, specifically examining the impact regulatory burdens have had on base load power sources, as well as the importance of fuel diversity in ensuring grid reliability. The study was initiated Friday and will continue over a two-month period.

"I am encouraged by Secretary Perry's decision to study the reliability of our energy grid," said Senator Capito. "If we are going to have affordable, reliable energy that powers our economy and advances our quality of life, we must maintain an adequate supply of base load electricity that is always available when it is needed. There is a role for multiple energy sources, including our own West Virginia coal and natural gas, as well as nuclear and renewables. But there is a clear difference between intermittent energy sources and base load power. A diversity in fuel sources and technologies is essential for a reliable and properly functioning electric grid. I am glad that the Department of Energy, under the new administration, recognizes that our coal, natural gas, and nuclear plants are vital assets in ensuring that affordable energy is always available to meet the needs of the American people."

Chairman Neil Chatterjee
Commissioner Cheryl A. LaFleur
Commissioner Robert F. Powelson
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

RE: Docket No. RM18-1-000, Grid Reliability and Resilience Pricing

Dear Chairman Chatterjee, Commissioner LaFleur, and Commissioner Powelson,

As members of the congressional delegation representing the state of West Virginia, we write you expressing our support for the Secretary of Energy's direction to the Federal Energy Regulatory Commission to issue grid resiliency pricing rules recognizing the value of fuel-secure baseload resources in the organized power markets within the jurisdiction of the Commission. We encourage the Commission to expeditiously and affirmatively direct the regional transmission organizations (RTOs) and independent operators (ISOs) to recognize the value of these fuel-secure electric generation sources to the grid's reliability and fuel security through cost-recovery for eligible units by utilizing the authorities granted to it by Congress in Sections 205 and 206 of the Federal Power Act.

West Virginia is an interstate energy exporter, sending more than half of its net electricity production across state lines through the PJM Interconnection, the nation's largest RTO. According to the Energy Information Administration (EIA), this makes West Virginia one of the top five states in net interstate sales of electricity. Additionally, the EIA finds that West Virginia is the second largest coal producer in the country, with three-quarters of that production going to other states.¹ As a result the state has a key role to play in our nation's energy infrastructure, generating fuel-secure baseload power for itself and its neighbors and providing additional fuel for other states' baseload electric generation generators.

We believe this integration of West Virginia into the national electric grid is a strength for both the state and the nation. However, in recent years historically high production and resulting low prices of natural gas, significant regulatory burdens, and market-distorting preferential subsidies and mandates for renewable sources have led to coal-fired power being unable to compete in regional electric markets. The nuclear industry is facing similar challenges. The result has been the closure and proposed closure of hundreds of coal and several nuclear generating units; as the Department of Energy noted in its Notice of Proposed Rulemaking

¹ EIA, "West Virginia State Profile and Energy Estimates." July 20, 2017. Accessed September 29, 2017.
<https://www.eia.gov/state/analysis.php?sid=WV>

(NOPR), some 63.7 gigawatts (GW) of coal and nuclear generation capacity was retired between 2002 and 2016, with another 25 GW slated for retirement in coming years.

The retirement of these units poses challenges to the grid's reliability and resilience, has implications for national security, and will put pricing challenges on consumers if market fundamentals shift. The current price advantages of natural gas and subsidized renewable energy in the electric markets are the result of volatile market forces and impermanent federal policies. While these fuel sources have important roles for providing fuel diversity and competitively priced intermittent and interruptible electricity, they do not provide the fuel-secure baseload electricity upon which American citizens and our economy depend.

As their name implies baseload resources can operate at nearly 100 percent capacity at all times, providing a consistent floor of supply in the marketplace and reducing volatility. Coal and nuclear plants also have months of on-site fuel resources, making them resilient to conventional and cyberattacks on pipeline infrastructure and giving them a greater deal of certainty in wholesale electricity prices.

Recent events, such as the 2014 Polar Vortex, demonstrate the risk to the resiliency of RTOs like PJM due to a loss of fuel-secure generation capacity and the lack of availability of variable generation resources. During the Polar Vortex, a potentially catastrophic blackout during a record and persistent cold weather event was only avoided because coal units then scheduled for retirement remained available to be brought back online to meet demand. If present trends continue those resources will not be available during a future capacity crunch. Those units have since retired.

These advantages of fuel-secure electric generation sources must not be taken for granted; yet the organized power markets are doing just that. Short-term marginal fuel price, regulatory overburden, subsidy, and policy mandate advantages for intermittent sources have rendered many baseload units uneconomical. Recognizing the threats posed by the loss of these key baseload resources, state governments such as Illinois and New York have implemented policies to prevent additional closures of coal and nuclear units. However, the interstate nature of the electric markets requires federal action. During the capacity auction process, the organized electric markets must acknowledge the importance of a reliable and resilient electric grid by compensating baseload resources for providing these functions.

The Commission is the federal agency best-suited to addressing these challenges. As you know, the Commission has studied the threats the loss of baseload generation capacity poses to the grid since 2013. FERC's unique authorities under Sections 205 and 206 of the Federal Power Act enable the Commission to address the market's undervaluation of baseload electricity by authorizing cost recovery for eligible fuel-secure baseload generation units within organized electric markets under the Commission's oversight.

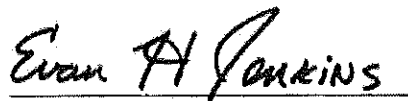

We support the Secretary's NOPR and encourage the Commission to take an affirmative final action to protect the reliability and resiliency of the nation's electric grid. Doing so is imperative for protecting the economy and security of West Virginia and the rest of the United

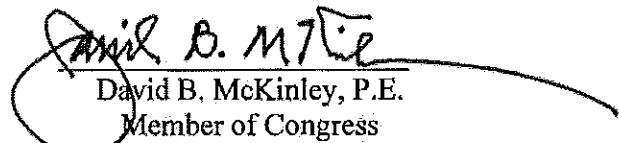

States and following through on congressional intent to maintain an all-of-the-above national energy policy.

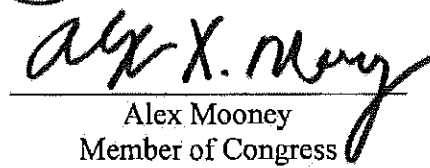

Thank you for your timely consideration of this request.

Sincerely,

Shelley Moore Capito

Washington, DC 20500

RE: Request for Emergency Order By FirstEnergy Solutions Corp. Under Federal Power
Act Section 202(c)

Dear Mr. President:

On behalf of DuPont, I am pleased to offer the following comments opposing FirstEnergy Solutions (FES) Corp.'s Request to the Department of Energy (DOE) for issuance of an Emergency Order under Section 202(c) of the Federal Power Act.

DuPont has numerous facilities in the PJM region that employs approximately 15,000 individuals, providing significant economic benefits to these states and the nation. As you know, higher energy and regulatory costs threaten the competitiveness of American job creators, industries, manufacturers, producers, and large industrial users. Higher energy prices also create an economic burden on our employees, and all consumers, in this region.

Section 202(c) of the Federal Power Act is confined to a limited scope of emergencies and imminent events. Section 202(c) solutions are temporary, targeted, and narrowly tailored and it is a power that has only previously been used during national emergencies and wartime. FES is inappropriately using Section 202(c) for internal economic reasons to bail out its failing assets.

The scope of the requested Emergency Order is unprecedented, overbroad, and conflicts with existing statutory and regulatory authority. The request is inconsistent with DOE's prior emergency orders. The request improperly asks DOE to take action that is reserved for the Federal Energy Regulatory Commission's (FERC) ratemaking authority. The request seeks relief that does not constitute "just and reasonable" compensation under the Federal Power Act.

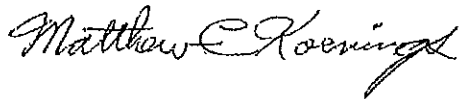

FES's Request also ignores decades of FERC precedent by requesting that PJM customers be forced to pay cost-based, non-market rates for power from FES's uneconomic nuclear and coal facilities. FES requests a return based on the full value of its assets, even when shareholders have already benefitted from writing down those same assets.

Granting the Request would be a government attempt to pick winners and losers undermining the competitive forces at play in wholesale electricity markets.

There is no looming emergency in the PJM region which requires a federal response. Very healthy electricity capacity reserves are available throughout the region targeted by the Request. Mechanisms and standards are in place to ensure reliable delivery of electricity. Energy prices are currently reflecting lower prices for natural gas and other electric generation fuels. An emergency order from the Department of Energy would be unnecessary, an overstep of authority and unlawful.

On behalf of Dupont, and our thousands of employees who will be affected by it, I strongly recommend that the Request be denied.

Sincerely,

Matthew C. Koenings
Vice-President — Corporate Operations

Washington, DC 20585

4/24/2018

Dear Chrissy,

In my e-mail of April 11, I shared a report on how the Regional Greenhouse Gas Initiative (RGGI) was reducing operating hours at coal-fired power plants by raising cost to cover carbon dioxide emission allowances, and making the plants less competitive in the PJM Regional Transmission Organization region. The report also showed how fewer operating hours has resulted in 13 percent lower operating efficiency, and I attach the report here again.

The latest RGGI auction is adding about \$4.17/megawatt-hour to coal-fired Electric Generating Units (EGUs) in Delaware and Maryland. In addition, an Environmental Protection Agency spreadsheet calculates the cost to run Selective Catalytic Reduction (SCR) pollution control equipment under various operating conditions (also attached). Since RGGI began, the SCR operation costs may have risen by \$2.45/megawatt-hour, and increased coal usage may have added another \$0.54, for a grand total of \$7.16/megawatt-hour in added costs. This is a significant amount considering the average PJM Delmarva Zone wholesale price in 2017 was \$35/megawatt-hour.

Assuming those higher costs are included in Clearing Price bids for the PJM Locational Marginal Price plan, these higher costs may be raising electricity costs for the entire PJM region as every EGU in the system receives the same Clearing Price, including the eleven non-RGGI states. Electricity pricing reverberates through our economy impacting U. S. competitiveness, jobs, and especially the poorest among us. Other PJM states are considering entering RGGI, so the cost impact may rise.

PJM keeps records of the winning EGUs in the LMP auction, but the published results are coded to protect confidential information. I am petitioning the DOE to work with PJM to answer the following questions:

- 1) On a monthly, and annual average, what percentage of the time are fossil fuel EGUs in Delaware and Maryland setting the Clearing Price for each hour of the day for the period 2015 through 2017?
- 2) If possible, compare this information for the three main fossil fuels; coal, petroleum liquids, and natural gas powered EGUs?
- 3) What impact are Delaware and Maryland EGU Clearing Price bids having on the annual average LMP?

Please direct this request to the appropriate individuals at DOE, and thank you so much for your assistance.

RE: Carbon dioxide cap and trade dramatically lower power plant efficiency, and increase emissions

DATE : 4/11/2018

David T. Stevenson, Director

Experience with the nine state Regional Greenhouse Gas Initiative (RGGI) has shown it may actually increase emissions at power plants forced to purchase emission allowances by lowering operating efficiency by turning base load power plants into load followers with intermittent operation. I calculate a 13% decline in efficiency from lower operating hours, compared to a potential 6% gain from all energy efficiency strategies in the Clean Power Plan.

Merchant coal-fired Electric Generating Units (EGU) in two RGGI states, Delaware and Maryland, in the PJM Interconnection Regional Transmission Organization were reviewed. Table 1 provides the combined operating information for coal-fired Chalk Point, MD units 1 and 2, Dickerson, MD, units 1, 2, and 3, and Indian River, DE unit 4.

Table 1: Operating Information for six coal-fired EGU's in MD and DE

Year	MMBTU	MWh	Tons CO2	Heat Rate	tons CO2/MWh	Operating Hours	Efficiency
2009	77,892,841	8,339,131	7,985,161	9341	0.958	40750	36.5%
2010	83,006,579	8,492,233	8,721,474	9774	1.027	41701	34.9%
2011	62,291,965	5,759,548	6,390,655	10815	1.110	32428	31.5%

Source: MMBTU, Ton CO2, and operating hours are from RGGI COATS at <https://rggi-coats.org/eats/rggi/index.cfm?hc=ISkgICAK>, MWh are from US Energy Information Agency Form 923 at <https://www.eia.gov/electricity/data/eia923/>, other columns calculated

Graph 1 uses information from Table 1, and shows how increasing RGGI emission allowance prices reduce operating hours. Coal-fired generation in non-RGGI states continued at about twice the RGGI state average.

Inside Energy

Published by the Caesar Rodney Institute
Center for Energy Competitiveness

Graph 1

DE/MD Merchant Coal-Fired Generating Units Operating Hours vs. RGGI Allowance Cost

Graph 2 also uses information from Table 1, and shows operating efficiency falls approximately 18.5% when operating hours are cut 60%. In the Clean Power Plan estimates of potential energy efficiency improvements totaled about 6%, so the impact of lower operating hours is about three times as large as all other energy efficiency improvements combined! Lower operating efficiency increases CO₂ emissions. The Indian River Power Plant in Delaware saw a 32% rise in emissions per MWh from 2012 when each MWh emitted 0.87 tons of CO₂ to 2017 when each MWh emitted 1.15 tons. More coal was used to produce each MWh.

Lower operating hours over the period has two probable sources; the rapidly falling fuel cost of natural gas compared to coal, and the added cost of carbon dioxide emission allowances. According to the US Energy Information 2017 Agency Annual Energy Outlook, the national average Capacity Factor for coal-fired EGUs, the actual operating hours compared to potential operating hours, for coal-fired EGUs dropped from 65.1% in 2009 to 51% in 2016, or about 1235 hours in reaction to lower natural gas prices. Average operating hours at the six EGU's in Maryland and Delaware fell 4048 hours between 2009 and 2016. So, the ratio of hours lost because of lower natural gas prices to RGGI allowance cost is about 30% to 70%. Therefore, RGGI accounted for about a 13% decline in energy efficiency at the six EGU's (18.5% X 70%). EPA should consider expanding this study beyond six operating units.

Graph 2

Six Merchant Coal Fired Power Plants in MD & DE Operating Efficiency v. Operating Hours

Cost Estimate

Total Capital Investment (TCI)

TCI for Coal-Fired Boilers

For Coal-Fired Boilers:

$$TCI = 1.3 \times (SCR_{cost} + RPC + APHC + BPC)$$

Capital costs for the SCR (SCR_{cost}) =	\$87,796,113
Reagent Preparation Cost (RPC) =	\$3,955,890
Air Pre-Heater Costs (APHC)* =	\$9,276,189
Balance of Plant Costs (BPC) =	\$7,215,176
Total Capital Investment (TCI) =	\$140,716,379

* This factor applies because the boiler burns bituminous coal and emits equal to or greater than 3lb/MMBtu of sulfur dioxide.

SCR Capital Costs (SCR_{cost})

For Coal-Fired Utility Boilers >25 MW:

$$SCR_{cost} = 270,000 \times (NRF)^{0.2} \times (B_{MW} \times HRF \times CoalF)^{0.92} \times ELEVF \times RF$$

For Coal-Fired Industrial Boilers >250 MMBtu/hour:

$$SCR_{cost} = 270,000 \times (NRF)^{0.2} \times (0.1 \times Q_B \times CoalF)^{0.92} \times ELEVF \times RF$$

SCR Capital Costs (SCR_{cost}) =

Reagent Preparation Costs (RPC)

For Coal-Fired Utility Boilers >25 MW:

$$RPC = 490,000 \times (NO_{x,in} \times B_{MW} \times NPHR \times EF)^{0.25} \times RF$$

For Coal-Fired Industrial Boilers >250 MMBtu/hour:

$$RPC = 490,000 \times (NO_{x,in} \times Q_B \times EF)^{0.25} \times RF$$

Reagent Preparation Costs (RPC) =

Air Pre-Heater Costs (APHC)*

For Coal-Fired Utility Boilers >25MW:

$$APHC = 69,000 \times (B_{MW} \times HRF \times CoalF)^{0.78} \times AHF \times RF$$

For Coal-Fired Industrial Boilers >250 MMBtu/hour:

$$APHC = 69,000 \times (0.1 \times Q_B \times CoalF)^{0.78} \times AHF \times RF$$

Air Pre-Heater Costs (APHC_{cost}) =

* This factor applies because the boiler burns bituminous coal and emits equal to or greater than 3lb/MMBtu of sulfur dioxide.

Balance of Plant Costs (BPC)

For Coal-Fired Utility Boilers >25MW:

$$BPC = 460,000 \times (B_{MW} \times HRF \times CoalF)^{0.42} \times ELEVF \times RF$$

For Coal-Fired Industrial Boilers >250 MMBtu/hour:

$$BPC = 460,000 \times (0.1 \times Q_B \times CoalF)^{0.42} \times ELEVF \times RF$$

Balance of Plant Costs (BOP_{cost}) =

Annual Costs

Total Annual Cost (TAC)

$$TAC = \text{Direct Annual Costs} + \text{Indirect Annual Costs}$$

Direct Annual Costs (DAC) =	\$4,090,330
Indirect Annual Costs (IDAC) =	\$11,350,077
Total annual costs (TAC) = DAC + IDAC	\$15,440,407

Direct Annual Costs (DAC)

$$DAC = (\text{Annual Maintenance Cost}) + (\text{Annual Reagent Cost}) + (\text{Annual Electricity Cost}) + (\text{Annual Catalyst Replacement Cost})$$

Annual Maintenance Cost =	$0.005 \times TCI =$
Annual Reagent Cost =	$q_{sol} \times \text{Cost}_{reag} \times t_{op} =$
Annual Electricity Cost =	$P \times \text{Cost}_{elect} \times t_{op} =$
Annual Catalyst Replacement Cost =	

For coal-fired boilers, the following methods may be used to calculate the catalyst replacement cost.

Method 1 (for all fuel types): $n_{scr} \times Vol_{cat} \times (CC_{replace}/R_{layer}) \times FWF$

Method 2 (for coal-fired utility boilers): $B_{MW} \times 0.4 \times (CoalF)^{2.9} \times (NRF)^{0.71} \times (CC_{replace}) \times 35.3$

Direct Annual Cost =

Indirect Annual Cost (IDAC)

$$IDAC = \text{Administrative Charges} + \text{Capital Recovery Costs}$$

Administrative Charges (AC) =	$0.03 \times (\text{Operator Cost} + 0.4 \times \text{Annual Maintenance Cost}) =$
Capital Recovery Costs (CR) =	$CRF \times TCI =$
Indirect Annual Cost (IDAC) =	$AC + CR =$

Cost Effectiveness

$$\text{Cost Effectiveness} = \text{Total Annual Cost} / \text{NOx Removed/year}$$

Total Annual Cost (TAC) =	\$15,440,407
NOx Removed =	5,553
Cost Effectiveness =	\$2,780

Chairman Neil Chatterjee
Commissioner Cheryl A. LaFleur
Commissioner Robert F. Powelson
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

RE: Docket No. RM18-1-000, Grid Reliability and Resilience Pricing

Dear Chairman Chatterjee, Commissioner LaFleur, and Commissioner Powelson,

As members of the congressional delegation representing the state of West Virginia, we write you expressing our support for the Secretary of Energy's direction to the Federal Energy Regulatory Commission to issue grid resiliency pricing rules recognizing the value of fuel-secure baseload resources in the organized power markets within the jurisdiction of the Commission. We encourage the Commission to expeditiously and affirmatively direct the regional transmission organizations (RTOs) and independent operators (ISOs) to recognize the value of these fuel-secure electric generation sources to the grid's reliability and fuel security through cost-recovery for eligible units by utilizing the authorities granted to it by Congress in Sections 205 and 206 of the Federal Power Act.

West Virginia is an interstate energy exporter, sending more than half of its net electricity production across state lines through the PJM Interconnection, the nation's largest RTO. According to the Energy Information Administration (EIA), this makes West Virginia one of the top five states in net interstate sales of electricity. Additionally, the EIA finds that West Virginia is the second largest coal producer in the country, with three-quarters of that production going to other states.¹ As a result the state has a key role to play in our nation's energy infrastructure, generating fuel-secure baseload power for itself and its neighbors and providing additional fuel for other states' baseload electric generation generators.

We believe this integration of West Virginia into the national electric grid is a strength for both the state and the nation. However, in recent years historically high production and resulting low prices of natural gas, significant regulatory burdens, and market-distorting preferential subsidies and mandates for renewable sources have led to coal-fired power being unable to compete in regional electric markets. The nuclear industry is facing similar challenges. The result has been the closure and proposed closure of hundreds of coal and several nuclear generating units; as the Department of Energy noted in its Notice of Proposed Rulemaking

¹ EIA, "West Virginia State Profile and Energy Estimates." July 20, 2017. Accessed September 29, 2017. <https://www.eia.gov/state/analysis.php?sid=WV>

(NOPR), some 63.7 gigawatts (GW) of coal and nuclear generation capacity was retired between 2002 and 2016, with another 25 GW slated for retirement in coming years.

The retirement of these units poses challenges to the grid's reliability and resilience, has implications for national security, and will put pricing challenges on consumers if market fundamentals shift. The current price advantages of natural gas and subsidized renewable energy in the electric markets are the result of volatile market forces and impermanent federal policies. While these fuel sources have important roles for providing fuel diversity and competitively priced intermittent and interruptible electricity, they do not provide the fuel-secure baseload electricity upon which American citizens and our economy depend.

As their name implies baseload resources can operate at nearly 100 percent capacity at all times, providing a consistent floor of supply in the marketplace and reducing volatility. Coal and nuclear plants also have months of on-site fuel resources, making them resilient to conventional and cyberattacks on pipeline infrastructure and giving them a greater deal of certainty in wholesale electricity prices.

Recent events, such as the 2014 Polar Vortex, demonstrate the risk to the resiliency of RTOs like PJM due to a loss of fuel-secure generation capacity and the lack of availability of variable generation resources. During the Polar Vortex, a potentially catastrophic blackout during a record and persistent cold weather event was only avoided because coal units then scheduled for retirement remained available to be brought back online to meet demand. If present trends continue those resources will not be available during a future capacity crunch. Those units have since retired.

These advantages of fuel-secure electric generation sources must not be taken for granted; yet the organized power markets are doing just that. Short-term marginal fuel price, regulatory overburden, subsidy, and policy mandate advantages for intermittent sources have rendered many baseload units uneconomical. Recognizing the threats posed by the loss of these key baseload resources, state governments such as Illinois and New York have implemented policies to prevent additional closures of coal and nuclear units. However, the interstate nature of the electric markets requires federal action. During the capacity auction process, the organized electric markets must acknowledge the importance of a reliable and resilient electric grid by compensating baseload resources for providing these functions.

The Commission is the federal agency best-suited to addressing these challenges. As you know, the Commission has studied the threats the loss of baseload generation capacity poses to the grid since 2013. FERC's unique authorities under Sections 205 and 206 of the Federal Power Act enable the Commission to address the market's undervaluation of baseload electricity by authorizing cost recovery for eligible fuel-secure baseload generation units within organized electric markets under the Commission's oversight.

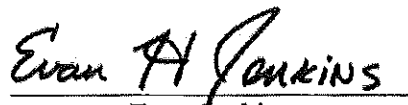

We support the Secretary's NOPR and encourage the Commission to take an affirmative final action to protect the reliability and resiliency of the nation's electric grid. Doing so is imperative for protecting the economy and security of West Virginia and the rest of the United

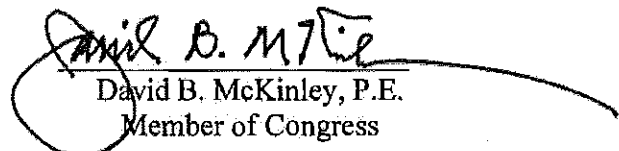

States and following through on congressional intent to maintain an all-of-the-above national energy policy.

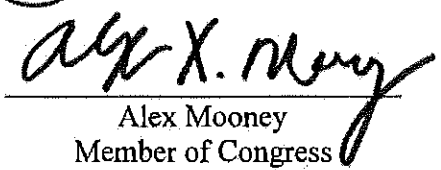

Thank you for your timely consideration of this request.

Sincerely,

Shelley Moore Capito
United States Senator

CC: The Honorable Rick Perry; Secretary,
Department of Energy

CAPITO ENCOURAGED BY ENERGY SECRETARY'S ELECTRIC GRID STUDY

WASHINGTON, D.C. — U.S. Senator Shelley Moore Capito (R-W.Va.) today applauded U.S. Department of Energy Secretary Rick Perry's decision to initiate a study of the nation's electric grid, specifically examining the impact regulatory burdens have had on base load power sources, as well as the importance of fuel diversity in ensuring grid reliability. The study was initiated Friday and will continue over a two-month period.

"I am encouraged by Secretary Perry's decision to study the reliability of our energy grid," said Senator Capito. "If we are going to have affordable, reliable energy that powers our economy and advances our quality of life, we must maintain an adequate supply of base load electricity that is always available when it is needed. There is a role for multiple energy sources, including our own West Virginia coal and natural gas, as well as nuclear and renewables. But there is a clear difference between intermittent energy sources and base load power. A diversity in fuel sources and technologies is essential for a reliable and properly functioning electric grid. I am glad that the Department of Energy, under the new administration, recognizes that our coal, natural gas, and nuclear plants are vital assets in ensuring that affordable energy is always available to meet the needs of the American people."

###

Congress of the United States
Washington, DC 20515

May 11, 2017

Dear Secretary Perry:

We commend you on your leadership at the Department of Energy (DOE) to highlight the importance of the nation's electric grid resilience. Your actions thus far have been well received by many of our constituents, and we support your efforts to prioritize the DOE's core missions.

It has come to our attention that you recently initiated a 60-day study exploring the long-term reliability of the electric grid, noting specifically that there is "concern about how certain policies are affecting, and potentially putting at risk, energy security and reliability". This study will be especially timely as Congress takes up comprehensive tax reform, crafts an energy infrastructure package, and considers the fiscal year 2018 budget. The input of the DOE on policy areas such as grid reliability, market incentives, and subsidies for particular types of energy production will be critical as we debate changes to the energy and tax landscape.

There are notable concerns among industry stakeholders that today's energy and electricity markets have been distorted by outdated and unnecessary incentives and subsidies. For example, it was recently noted by the U.S. Energy Information Administration that tax credits have made some types of energy production outlandishly competitive due to their subsidies – in some cases, even below the prevailing market rates of comparable energy sources.

Today's power generation mix provides us with an abundant variety of domestic energy sources. These provide our various states and regions the flexibility to tailor their electricity generation capacity to meet the demands of American businesses and families. Affordable and reliable energy is a key concern for our domestic manufacturers, enabling them to compete and thrive in the global marketplace. In order to optimize the economic efficiency of the electric grid and ensure the wise use of taxpayer dollars, we recommend your study include proposals that review the impact of leveling the disparity in tax credits and subsidies with the comparative costs of energy generation.

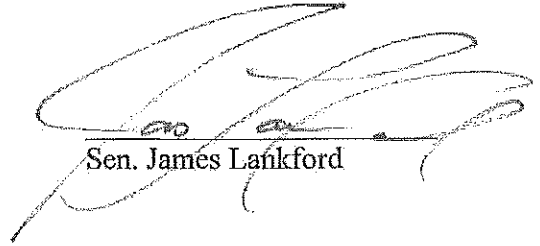

Additionally, we urge you to consider the national security implications of incentivizing specific types of energy generation. The vital role that baseload power plants, especially those with fuel readily available onsite, play in grid reliability and resiliency is an essential component of sound energy policy. These plants are the backbone of the nation, and carry our power system through extended emergencies like the Polar Vortex that impacted the United States in late 2013 to early 2014. Unfortunately, these plants are closing at a rapid pace, and many more are at risk of closure in the near future. Whether in response to natural disasters, extreme weather, or national security emergencies, being able to ensure we have adequate baseload power during times of critical demand should be a prime objective of your Department's review.

Thank you for your consideration of our recommendations. If you have any questions, please do not hesitate to contact our offices at (202) 225-3452 or (202) 224-5754.

Sincerely,

A handwritten signature in black ink, appearing to read "Evan Jenkins", written over a horizontal line.

The Honorable Scott Perry
Secretary
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, DC 20585

Dear Secretary Perry:

On behalf of the Congressional Coal Caucus, which represents thousands of coal miners, their families, and the millions of Americans who depend on coal for affordable and reliable electricity, I want to applaud you and the Department of Energy (DOE) for your April 14, 2017, memorandum that initiated an important and timely analysis of electricity markets and grid reliability.

This issue has been a priority for the Coal Caucus and on September 23, 2016, the attached letter was sent to the Federal Energy Regulatory Commission (FERC) expressing concerns that competitive markets do not adequately compensate baseload power generation and urging the Commission to investigate this matter.

As you know, electricity consumers throughout the country depend on a safe, reliable, and affordable supply of power. Baseload power plants – especially those with fuel security (fuel on site, coal) – are critical to meeting this need and ensuring the reliability and resiliency of our nation's grid. We especially need these power plants to carry the power system through extended emergencies, like we saw during the Polar Vortex in 2014. But, coal plants have been closing at a rapid pace and many more are very much at-risk. Therefore, it is imperative that we identify why these critical power generators are closing and develop policies to prevent further closures and ensure long-term grid resiliency, reliability and energy security.

Again, thank you for initiating this DOE study and look forward to working with you on this matter. Should your staff have any questions, do not hesitate to reach out to my Policy Advisor, Blake Deeley, by phone (202) 225-4172 or by email at blake.deeley@mail.house.gov.

Sincerely,

David B. McKinley, P.E.

Re: Grid Resiliency Pricing Rule
FERC Docket No. RM18-1-000

COMMENTS OF THE IRON WORKERS LOCAL UNION NO. 549 IN SUPPORT OF THE PROPOSED RESILIENCY RULE

On September 28, 2017, the Department of Energy ("DOE") issued the "Grid Resiliency Pricing Rule" (the "Proposal") directing the Federal Energy Regulatory Commission ("FERC") to adopt a rule requiring operators of organized markets to "ensure that certain reliability and resiliency attributes of electric generation sources are fully valued." Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations in West Virginia will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the region.

The Iron Workers Local Union No. 549 strongly supports the Proposal and shares the Secretary's urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members' loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of crucial power plants needed for reliability for some time. FERC

has the requisite basis to act now. There is no time for delay. In addition to acting promptly, FERC should also direct organized market operators to issue a comprehensive and enduring set of rules, based on the regulatory language of the Proposal, for the proper compensation of critical power plants. Protracted proceedings undertaken by organized market operators that fail to develop fair, compensatory and transparent rules will only engender market uncertainty and delay in providing sufficient compensation to these facilities, thereby jeopardizing the operation of the very plants that the DOE seeks to maintain in operation.

I. COMMUNICATIONS

All communications, correspondence, and documents related to this proceeding should be directed to the following person:

Bengy Swanson
Business Manager/ F.S.T.
Iron Workers Local Union No. 549

iron549@comcast.net

II. DESCRIPTION OF IRON WORKERS LOCAL 549

International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers.

III. DESCRIPTION OF IRON WORKERS LOCAL 549'S INTEREST IN PROCEEDING

The Iron Workers Local Union No. 549 is a party to a collective bargaining agreement with the owners of baseload coal and nuclear power plants located in West Virginia. Our members work on major infrastructure and industrial development projects that are dependent on the continued operation of the baseload coal and nuclear power plants. As a result, the wages, terms and conditions of employment of its members may be directly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, the Iron Workers Local 549 members have a direct and substantial interest in this proceeding. As well, the unique perspective

of the Iron Workers Local Union No. 549 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in West Virginia electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across West Virginia. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in West Virginia provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to Iron Workers Local Union No. 549 members. For example, AEP Mitchell Power Station, First Energy Harrison Power Station, Ft. Martin Power Station directly employs approximately 50 people, and the maintenance and capital improvement work on these plants supports the local economy by creating well-paying union jobs. In addition, the AEP Mitchell Power Station, First Energy Power Station, Ft. Martin Power Stations contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to

replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed, reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled (and specifically trained and experienced) employees, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in West Virginia, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, the [insert shortened name or acronym] strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by the comments considered in this proceeding. FERC has thoroughly considered the impact of electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of pre-mature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Secretary Perry,

I am pleased to submit the attached comments from the [Advanced Energy Buyers Group](#), a coalition of large energy users, in response to the Department of Energy's [request for input](#) on the use of its authority under Section 202(c) of the Federal Power Act.

Please do not hesitate to reach out to me if you have any questions or would like to follow up with the AE Buyers Group.

Respectfully,

Caitlin Marquis

Advanced Energy Buyers Group Comments Re: Federal Power Act (FPA) § 202(c)

Submitted to AskOE@hq.doe.gov

April 25, 2018

COMMENTS OF THE ADVANCED ENERGY BUYERS GROUP

The Advanced Energy Buyers Group (“AE Buyers Group” or “Group”) appreciates the opportunity to provide brief comments to the Department of Energy (“DOE” or “Department”) in response to the recent request from FirstEnergy Solutions (“FES”), specifically regarding the Department’s potential use of its Federal Power Act (“FPA”) § 202(c) authority.¹

The AE Buyers Group strongly urges DOE against use of its § 202(c) authority in this case because doing so is inconsistent with the statute, would be an unlawful departure from its prior use, and would undermine competitive wholesale markets while raising electricity prices at the cost of electricity consumers such as our companies. Furthermore, we note that there is no reliability or resilience emergency in PJM Interconnection (“PJM”) that warrants emergency

¹ These comments represent the consensus view of the Advanced Energy Buyers Group (<https://info.aee.net/ae-buyers-group>). However, this document does not necessarily reflect the position of any specific member of the AE Buyers Group, and these comments should not be attributed to any individual company or companies participating in the AE Buyers Group.

government intervention, and that even if any reliability or resilience concerns were to be identified as a result of FES's announced plant retirements, PJM already has many tools at its disposal to respond to such threats, and ample time to do so.

ABOUT THE AE BUYERS GROUP

The Advanced Energy Buyers Group is a business-led coalition of large energy users engaging on policies to expand opportunities to procure energy that is secure, clean, and affordable. Our companies are among the 71% of Fortune 100 companies and 43% of Fortune 500 companies that have established renewable and/or climate targets as part of our corporate sustainability commitments. Members of the AE Buyers Group are leading companies and organizations spanning a range of market sectors. We share a common interest in expanding our use of advanced energy, such as renewable energy like wind, solar, geothermal, and hydropower; demand-side resources like energy efficiency, demand response, and energy storage; and onsite generation from solar photovoltaics, advanced natural gas turbines, and fuel cells.

In 2017, members of the AE Buyers Group totaled over \$1 trillion in revenue and collectively consumed over 18 terawatt hours ("TWh") of electricity, including over 11 TWh hours of renewable electricity, equivalent to the electricity sales for the states of North Dakota and Delaware, respectively. This collective electricity use includes a significant footprint in the PJM region.

MOTION TO INTERVENE

The AE Buyers Group is not aware of any formal "proceeding" to consider FES's March 29, 2018 request that would require intervention (and granting of party status) to preserve its rights to fully participate under the FPA. Nevertheless, as a precaution and to preserve our rights in any

ongoing or future proceeding, the AE Buyers Group respectfully requests leave to intervene and be granted party status with respect to FES's request. Given the significant footprint of the AE Buyers Group in the PJM region and the unique perspective of the Group as described above, the AE Buyers Group submits that it has a significant interest in this matter that cannot be adequately represented by any other party.

COMMENTS

The AE Buyers Group is extremely concerned that FES's request would violate DOE's authority and disrupt wholesale markets at the expense of consumers, while ignoring readily available options to address any reliability or resilience concerns that are found to exist. The AE Buyers Group's comments are organized as follows:

- I. Granting FES's request would undermine competitive markets at significant cost to consumers;
- II. FES's request has not met the statutory requirements of § 202(c), and granting the request would be a significant and unlawful departure from DOE's prior use of the statute;
- III. There is no imminent resilience or reliability emergency in the PJM market, as PJM itself has made clear; and
- IV. Existing tools in the PJM market are available and more appropriate to identify and address any reliability or resilience challenges posed by retirement of FES's plants.

These comments are explained in more detail below.

- I. Granting FES's request would undermine competitive markets at significant cost to consumers.**

FES's request is fundamentally antithetical to the principles of competitive markets, and granting this request would increase costs and undermine market competition in the near-term while also setting a dangerous precedent and reducing confidence in the federal government's commitment to the principles of competition in wholesale electricity markets.

In particular, the AE Buyers Group is concerned that granting FES's request—which appears to be intended to apply to its entire fleet and to all other coal and nuclear plants in PJM, not just the plants slated for retirement—would disrupt the core function of competitive wholesale markets and undermine competition by limiting the ability of these markets to send accurate price signals and drive optimal, cost-effective market outcomes.² This approach is inconsistent with long-standing efforts by federal regulators and policymakers to maintain and improve the competitive wholesale markets, and would result in direct harm to our companies along with many other customers.

Wholesale markets have been very successful at accurately discovering the value of electricity production and sending efficient price signals to generators and consumers to deliver the most cost-efficient market supply outcomes. The cost-saving benefits of competitive wholesale markets have been confirmed by independent analysis, and by regional transmission organizations (“RTOs”) and independent system operators (“ISOs”), including PJM.³ Clear and accurate prices

² While the AE Buyers Group notes that providing more limited relief just to the plants slated for retirement would have a smaller financial impact, the Group wishes to emphasize that there would still be a financial cost. Even more importantly, this more limited application would have the same effect of undermining confidence in markets and setting an extremely troubling precedent.

³ See Steve Cicala, *Imperfect Markets versus Imperfect Regulation in U.S. Electricity Generation*, University of Chicago (Jan. 2017), available at http://home.uchicago.edu/~scicala/papers/elec_gov_v_mkt_draft_2.pdf, concluding, “markets reduce production costs by \$3B per year by reallocating output among existing power plants,” with some of these savings coming from a 20% reduction in the cost of operating uneconomic plants due to a 10% reduction in utilization; PJM Interconnection, *PJM Value Proposition*, <http://www.pjm.com/about-pjm/value-proposition.aspx>, estimating a \$2.8 to \$3.1 billion net annual benefit to customers from PJM's operation of the competitive regional wholesale market, including \$600 million in annual savings due to enabling “less efficient generation resources to retire and to be replaced with more efficient, less costly, plants”; and, MISO, *Value*

in a stable policy environment are critical to enabling the development and deployment of new energy technologies that help advance economic growth while still meeting customer needs for electricity that is both reliable and resilient. Allowing cost-of-service-based regulation and undue emergency relief into this market system would, in contrast, undermine the accuracy of these price signals and result in inefficient market outcomes.

Further, in addition to our perspective as consumers highly dependent on a reliable, resilient, and affordable supply of electricity, our companies are also active participants in the wholesale electricity system, pursuing clean energy projects to meet our corporate energy and sustainability targets and to control our electricity costs. In the competitive wholesale markets regulated by FERC, we are taking full advantage of the choice afforded to us as customers to pursue long-term contracts with advanced energy installations. By inserting new cost-based rates into existing wholesale markets, and by providing cost-of-service support for uneconomic units without material benefit to the energy system, FES's request would create distortionary effects that will directly harm our existing energy supply contracts and limit our ability to pursue such transactions in the future.

Any effort to respond to and address potential threats to grid reliability and resilience should make use of market principles to encourage innovation and competition, calling upon the full suite of available options and allowing cost and performance to serve as the metric for success.

Proposition, <https://www.misoenergy.org/WhatWeDo/ValueProposition/Pages/ValueProposition.aspx>, finding that in 2016 MISO, "provided between \$2.6 billion and \$3.3 billion in regional benefits, driven by enhanced reliability, more efficient use of the region's existing transmission and generation assets, and a reduced need for new assets."

II. FES's request has not met the statutory requirements of § 202(c), and granting the request would be a significant and unlawful departure from DOE's prior use of the statute.

The Federal Power Act sets very specific limitations on DOE's use of § 202(c), which have not been met in this case. Specifically, § 202(c) allows DOE to intervene in the electricity industry only during an emergency that threatens national security, specifically defined as times of "war" or during "sudden" increases in demand or shortages of supply,⁴ with "emergency" defined as "unexpected . . . events [that] may be the result of weather conditions, acts of God, or unforeseen occurrences not reasonably within the power of the affected "entity" to prevent."⁵ DOE's implementing regulations specifically note that "economic factors . . . generally will not be considered as emergencies unless the inability to supply electric service is imminent."⁶ Even where 202(c) authority is found to be justified, this authority extends only to the "hours necessary to meet the emergency."⁷

None of these statutory requirements have been met in FES's request. The FES retirement announcements will not go into effect for a matter of years, and cannot be reasonably interpreted as a "sudden" shortage of supply or an instance in which "the inability to supply electric service is imminent."

As such, granting FES's request would represent a significant disregard for the statutory requirements, and would also be a significant departure from DOE's prior use of its 202(c)

⁴ 16 U.S.C. § 824(c)(1).

⁵ 10 C.F.R. § 205.371.

⁶ *Id.*

⁷ 16 U.S.C. § 824(c)(2).

authority, which has been limited to specific emergency events (e.g., Hurricanes Katrina and Ike) and specific plants over specified periods (in response to extreme circumstances, i.e., lightning and flooding that interrupted plant construction). The FES request does not bear any resemblance to these prior uses of DOE's 202(c) authority. The AE Buyers Group sees no evidence in the statute that FES's request is within DOE's authority.

III. There is no imminent resilience or reliability emergency in the PJM market, as PJM itself has made clear.

Members of the AE Buyers Group include technology companies, manufacturers, and retailers—all sectors heavily reliant upon a reliable and resilient source of electricity. Our companies require a steady supply of electricity on a 24-hour basis, 365 days a year, and we pay a significant price for breaks in service, whether they be small disturbances to the distribution system or large outages of the bulk power system. Estimates place the cost of infrastructure failures for large enterprises at \$100,000 per hour, and for many of our businesses the costs are much higher.⁸

Given our dependence upon reliable and resilient electricity, and the consequences to our businesses of a loss of electricity supply, we carefully monitor and analyze any threats to this supply, and support necessary and cost-effective investments or actions to maintain a reliable electricity system. While there can always be incremental improvements in reliability and resilience, it is our view as engaged and highly invested consumers that FES's announced plant retirements do not present an imminent threat to reliability and resilience in PJM.

⁸ Eaton, *Blackout Tracker: United States Annual Report 2016* (2017), available at <http://electricalsector.eaton.com/forms/BlackoutTrackerAnnualReport>, at 6.

Numerous recent assessments of the reliability and resilience of the bulk power system (“BPS”) have concluded that the state of the electricity system is sound, and that it is successfully adjusting to a shifting resource mix. For example, the North American Electric Reliability Corporation (“NERC”) recently reached the overarching conclusion that the state of the electricity system is sound. At a hearing before the House Subcommittee on Energy in September 2017, NERC President and Chief Executive Officer Gerry Cauley testified that “even with all the changes underway, the BPS remains highly reliable and resilient, showing improved reliable performance year over year.”⁹ He also expressed confidence that the system would continue to perform well despite changes to the generation mix, stating, “With appropriate insight, careful planning, and support, I am confident the electricity sector will continue to navigate these changes in a manner that results in enhanced reliability and resilience.”¹⁰

Of particular importance here, we note that PJM itself made clear to DOE that FES’s announced plant retirements do not threaten grid reliability or resilience. In a letter to the Secretary dated March 30, PJM wrote: “PJM can state *without reservation* there is no immediate threat to system reliability” (emphasis added).¹¹ This unequivocal assessment by PJM clearly indicates that use of § 202(c) authority in response to FES’s request would be unjustified.

⁹ Gerry W. Cauley, Direct Testimony before the Subcommittee on Energy, House Committee on Energy and Commerce, “Powering America: Defining Reliability in a Transforming Electricity Industry” (Sept. 14, 2017), available at <http://www.nerc.com/news/Documents/HEC9-14-17%20Cauley%20Testimony%20Final.pdf>, at 1.

¹⁰ *Id.*

¹¹ Vincent P. Duane, Letter to Secretary Perry Re: FirstEnergy Solutions’ Request for Emergency Relief under Section 202 of the Federal Power Act (March 30, 2018), <http://www.pjm.com/-/media/documents/other-fed-state/20180330-response-to-fe-solutions-request-for-emergency-relief.ashx>.

IV. Existing tools in the PJM market are available and more appropriate to identify and address any reliability or resilience challenges posed by retirement of FES's plants.

The announced FES plant retirements do not pose an imminent threat, and PJM has tools to identify and address any reliability or resilience challenges posed by these retirements, as well as ample time to deploy them. Application of such tools offers a more appropriate response to FES's announced retirements—one that relies on routine implementation of PJM's established authority rather than what would be, as PJM describes it, “unnecessary, extraordinary and precedential” action on behalf of FES.

In particular, PJM notes that the plants slated for retirement “will remain operational in most cases until through May 2021,” and that the retirements are not binding. In the meantime, PJM plans to follow an orderly and routine process to assess the impact of these retirements, which it outlines in its March 30 letter to the Secretary:

“PJM will undertake a thorough analysis of its system to determine whether the announced retirements would present systemic adequacy issues or any local reliability issues, such as insufficient voltage support. Should any such finding result, the PJM Tariff provides an additional 60 days to work with FES and a range of tools available, including ordering transmission system upgrades and, if necessary, offering full cost of service compensation under Part V of the PJM Tariff to induce assets to remain temporarily on-line. Ultimately, PJM could also join FES in its instant request should other remedial options prove insufficient.”¹²

The AE Buyers Group is satisfied that PJM is already taking steps to assess any threats to the reliability and resilience of our electricity service, and that there is sufficient time between now and the retirement of FES's plants to implement any necessary corrective measures. In the

¹² *Id.*

meantime, we see no justification for intervention by DOE that would short-circuit PJM's established process.

CONCLUSION

The AE Buyers Group appreciates the opportunity to provide input on FES's request, and we respectfully request DOE's consideration of our perspective in this case.

Signed,

The Advanced Energy Buyers Group

COUNTERFLOW: The Surreal, the Absurd and the Tragic Edit

(<https://www.rtoinsider.com/wp-admin/post.php?post=91238&action=edit>)

April 24, 2018

By Steve Huntoon

The Surreal

I'd like to apologize — on behalf of FirstEnergy — for dragging countless congressmen into the arcane world of the electric utility industry. You've had to listen to millionaire lobbyists — the quintessential swamp — talking about stuff so dry that we who toil in this world aren't allowed to talk to our spouses about it.

And biggest apology to Sen. Manchin because you re the biggest victim. Bailout for FirstEnergy via the Defense Production Act of 1950? OMG.

Do you think if there were a scintilla of national security threat we might have heard something from, hmm, let s see, maybe the Defense Department?

But here we are.

If you're just listening to FirstEnergy's lobbyists, you've missed a few key facts. FirstEnergy's plants are:^[1]

- Not base load.
- Old – not retiring prematurely.
- Inefficient.
- Unreliable.
- Not needed for a reliable and resilient grid.

In the tough competition for weakest bailout argument, the winner is the argument that if we didn't have all the coal plants we had last winter, there would have been an electricity problem, which is like saying if we didn't have all the Fords we had last winter, there would be a car problem. Duh.

All the Fords aren't disappearing overnight. And the Fords that do disappear are being replaced by better Fords.

A weaker argument for subsidizing old, inefficient and unreliable plants is hard to imagine. If it had prevailed 100 years ago, we'd still be driving Model T's.

Quick Quiz

Let's see if you've been conned with a quick quiz question: The Department of Energy projects in the year 2050, 32 years from now, there will be this much coal and nuclear generation in the United States:

1. 0 gigawatts
2. 10 gigawatts
3. 100 gigawatts
4. 274 gigawatts

The answer is (d) 274 gigawatts.^[2] Yes, Rick Perry's own Department of Energy projects a huge amount of coal and nuclear generation to be around for the *next 32 years*.

(https://i0.wp.com/www.rtoinsider.com/wp-content/uploads/Steve-Huntoon-content-14-1.jpg?ssl=1)

Hun oon

It's a con to pretend coal and nuclear plants will disappear quickly (or at all), causing any sort of reliability problem — and to premise a bailout on such fantasy.

The Absurd

The absurd is that all the responsible entities in the electric industry know there is no emergency. All the independent grid operators, the unanimous Federal Energy Regulatory Commission (where four of the five Commissioners are Trump appointees), former federal regulators, and all the independent analysts have repeatedly said that. These would be the first to warn of an emergency if one actually existed.

Compounding the absurdity, earlier this month FirstEnergy told the bankruptcy court that all its coal and nuclear plants would be operating throughout its bankruptcy proceeding.^[3] That proceeding will take at least five to six years.^[4]

That means all the FirstEnergy plants will be operating for at least the next five or six years.

(<https://i1.wp.com/www.rtoinsider.com/wp-content/uploads/WSJ-Murray-story-excerpt-content.jpg?ssl=1>)

On top of that, Robert Murray, coal CEO and FirstEnergy's fellow traveler, told *The Wall Street Journal* earlier this month there was no longer any need for a bailout to save his company from bankruptcy because of increased exports to Asia.^[5] He now "expects his company to thrive whether or not the Trump administration intervenes," the *Journal* reported.

There is no fire. Or even a puff of smoke.

The Tragic

FirstEnergy's customers paid it \$6.9 billion in return for the company's transition from a regulated environment to a competitive environment. If that "bet" had turned out well, FirstEnergy would, of course, have kept the money. It hasn't gone as well as FirstEnergy anticipated, and now FirstEnergy wants customers to bail them out all over again.

I didn't realize just how outrageous that was until poring through the record of FirstEnergy's stranded cost proceeding in Ohio from almost 20 years ago. FirstEnergy's stranded costs were based on the difference between their regulated "net book value" and their net revenues in the future under market conditions.

Please bear with me. "Net book value" is the original cost of the plants reduced by the amount of capital that customers already have reimbursed the utility (a.k.a., depreciation). So, when FirstEnergy was paid net book value (less the future market revenues it would get to keep), it was paid the rest of the plant costs that customers hadn't already paid for.

In other words, customers have already paid for 100% of FirstEnergy's plants. FirstEnergy may retain legal title, but in equity the customers own the plants.

Can you imagine the tragedy of customers having to pay for those old, inefficient and unreliable plants all over again?

Let's hope a surreal and absurd bailout and a tragic rate increase don't come to pass. And if they do, let's hope voters figure out who's responsible.

1. A lot of this is common knowledge in the industry. For my own takes, the non-base load, old and inefficient nature of these plants is discussed here: <http://www.energy-counsel.com/docs/Clunker-Poster-Child.pdf> (<http://www.energy-counsel.com/docs/Clunker-Poster-Child.pdf>). The unreliable nature of these plants is discussed here: <http://www.energy-counsel.com/docs/Cash-for-Clunkers-Redux-RTO-Insider.pdf> (<http://www.energy-counsel.com/docs/Cash-for-Clunkers-Redux-RTO-Insider.pdf>).

Subject: Baseload Generation
Date: Wednesday, April 25, 2018 3:54:26 PM
Attachments: [Beaver valley letter 1.pdf](#)
[Beavey Valley 2.pdf](#)

I am writing to you today to show our continued support for baseload generation which includes both nuclear and coal-fired units, these types of plants give this country the most electrical stability and resiliency possible. These plants have fuel onsite to keep them operational for many months at a time and are very dependable and are critical in maintaining the power needed to run this great country. We urge you to issue an emergency order pursuant to Federal Power Act Section 202(c).

Respectfully

Kenn Bradley

Secretary Perry
U.S. Department of Energy
1000 Independence Ave., SW
Washington, DC 20585

Dear Secretary Perry,

Unions, labor and power plant workers across the country applaud the Department of Energy's study examining electricity markets, the value of baseload power and the long-term security and resiliency of the electric grid. Baseload coal and nuclear power plants employ more than 154,000 workers, produce major infrastructure projects that put Americans to work, and support a resilient electric grid. Local Union 29 represents over 500 of these power plant workers in Western Pennsylvania that work in nuclear and coal plants.

Baseload power plants have long been the "work horses" of the electric system, providing energy to customers 24 hours a day, 365 days a year. With significant on-site fuel reserves, they provide the resiliency required to keep electricity flowing under all circumstances since their operation is not subject to interruption by extreme events such as weather or attacks on infrastructure that disrupt fuel delivery to other generation resources. Recently, EPA Administrator Pruitt noted as much when he talked about the consequences of an attack on key infrastructure. Our nation's security is dependent on maintaining these plants to support a resilient supply of electricity.

However, numerous baseload power plants have permanently shut down in recent years, and many more are expected to close prematurely in the very near future. Once they are gone, they are gone for good. Baseload generation is under serious threat from market-distorting subsidies and mandates, regulations that target these resources, low natural gas prices and markets that don't value resiliency. We are at a crisis point. Further decline in the number of plants will not only impact the grid and national security, it will cost valuable jobs and discourage industrial development opportunities nationwide. This is an outcome America simply can't afford.

Our baseload power plants and the dedicated, skilled workers who operate them are the lifeblood of their communities. They deliver a strong tax base and support between three and eight times more high-paying jobs than do other forms of electricity generation. We depend on these plants to create a robust workforce, and the country depends on them to support a healthy economy and electricity supply.

Unless action is taken, the long-term viability of baseload power plants along with the jobs and substantial economic opportunities they bring is at risk. And, our national security could be compromised if we don't ensure a resilient grid. We encourage the Administration to take prompt and meaningful action to protect baseload power plants and America's energy future.

Sincerely,

Jeff Davis
Business Manager

Re: Grid Resiliency Pricing Rule
FERC Docket No. RM18-1-000

**COMMENTS OF THE INTERNATIONAL BROTHERHOOD OF ELECTRICAL
WORKERS, LOCAL UNION 29 IN SUPPORT OF THE PROPOSED RESILIENCY
RULE**

On September 28, 2017, the Department of Energy (“DOE”) issued the “Grid Resiliency Pricing Rule” (the “Proposal”) directing the Federal Energy Regulatory Commission (“FERC”) to adopt a rule requiring operators of organized markets to “ensure that certain reliability and resiliency attributes of electric generation sources are fully valued.” Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations in Pennsylvania will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the region.

IBEW Local 29 strongly supports the Proposal and shares the Secretary’s urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members’ loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of crucial power plants needed for reliability for some time. FERC has the requisite

basis to act now. There is no time for delay. In addition to acting promptly, FERC should also direct organized market operators to issue a comprehensive and enduring set of rules, based on the regulatory language of the Proposal, for the proper compensation of critical power plants. Protracted proceedings undertaken by organized market operators that fail to develop fair, compensatory and transparent rules will only engender market uncertainty and delay in providing sufficient compensation to these facilities, thereby jeopardizing the operation of the very plants that the DOE seeks to maintain in operation.

I. COMMUNICATIONS

All communications, correspondence, and documents related to this proceeding should be directed to the following person:

Kenn Bradley
Business Mgr.
IBEW Local 29
986 Greentree Road, Pittsburgh, PA 15220
412-922-6969
kbradley@ibew29.org

II. DESCRIPTION OF IBEW LOCAL 29

IBEW Local 29 is a progressive labor organization that represents individuals in the Utility, and Generation industries.

III. DESCRIPTION OF IBEW LOCAL 29'S INTEREST IN PROCEEDING

IBEW Local 29 is a party to collective bargaining agreements with the owners of baseload coal and nuclear power plants located in Pennsylvania. As a result, the wages, terms and conditions of employment of its members may be directly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, IBEW Local 29 members have a direct and substantial interest in this proceeding. As well, the unique perspective of IBEW Local 29 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The recent decline in Pennsylvania's electric power industry, for example, has led to reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across Pennsylvania. This has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants in Pennsylvania provide thousands of MWs of reliable power, and provide union jobs and economic opportunities to IBEW Local 29 members. The Beaver Valley, Cheswick, and Brunot Island generation stations directly employ approximately 500 IBEW Local 29 members, and the maintenance and capital improvement work on these plants supports the local economy by creating thousands of well-paying union jobs for contractors. In addition, these plants contribute millions each year in state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout the local economy, will have a severely detrimental impact on the region.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed,

reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

Second, premature plant closures will deplete the stable of highly skilled (and specifically trained and experienced) employees, many of whom have lived in the region for several years and who take great pride in their work. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and, as important, our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the region's electricity supply and on the reliable operation of the regional electricity system.

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of the nuclear and coal-fired generating facilities in Ohio, it is essential that the FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, IBEW Local 29 strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. FERC has a sufficient record to act that will be further bolstered by

the comments considered in this proceeding. FERC has thoroughly considered the impact of electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of premature closures.

In acting promptly, FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

Respectfully submitted,

Kenn Bradley

RE: Grid Resiliency Pricing Rule
FERC Docket No. RM 18 – 1 – 000

COMMENTS OF THE OHIO AFL-CIO IN SUPPORT OF THE PROPOSED GRID RESILIENCY PRICING RULE

As the Labor Federation in Ohio, representing over 500,000 workers including those in all aspects of the generation and distribution of energy, we support the proposed Grid Resiliency Pricing rule. The Ohio AFL-CIO has maintained an "all of the above energy strategy" that allows for a diversified energy portfolio. We believe that the proposed Grid Resiliency Pricing Rule falls within that strategy. If adopted, the proposed rule will ensure that existing nuclear and coal-fired electric generating stations in Ohio will be fairly compensated for their costs of operation and avoid premature retirement.

The importance of these plants remaining operational cannot be overstated. We have seen the devastation that occurs in our communities when major employers leave a region. Ohio's industrial economy has been hit disproportionately hard with the loss of over 320,000 manufacturing jobs in the last decade alone. These generating stations are, in some cases, the largest employers and catalysts for economic prosperity and growth in these areas. The continued operation of these plants is necessary for current energy needs and a major factor in attracting new businesses and economic development.

These energy facilities are crucial for the livelihood and viability of the thousands of workers who operate and maintain them, their families, and the communities in which they live. These plants contribute millions of dollars each year in state and local tax revenue that support local schools, police and fire departments, and other vital public services. If these plants close, the loss of jobs, tax revenue, and the ripple effect of such losses will be felt in every corner of Ohio.

Furthermore, the continued operation of the Davis-Bessie and Perry Nuclear Facilities, as well as the Bayshore, JM Stuart, Kyger Creek and Killen coal-fired plants are necessary to maintain a reliable supply of electricity for the region's energy intensive economy and grid stability. Preserving base load coal and nuclear power plants will keep these needed, reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our region's dynamic need for reliable electricity.

www.ohafcio.org

Ohio AFL-CIO | 500 South Front Street, Suite 700 | Columbus, OH 43215 | phone 614.224.8271 | fax 614.224.2671

For these reasons the Ohio AFL-CIO supports the proposed Grid Resiliency Pricing Rule. It is of utmost importance to workers in these facilities, the communities in which they live, and grid stability that the Commission deliberates in a timely manner and issues a final rule. Thank you for your consideration and please do not hesitate to contact my office with any questions.

Congress of the United States
Washington, DC 20515

February 21, 2018

**The Honorable Donald J. Trump
President of the United States
The White House
1600 Pennsylvania Avenue, NW
Washington DC 20500**

Dear Mr. President,

We write to express our concern regarding the preservation of our nation's fuel-secure generation capacity and threats to the resiliency of the nation's electric grid. We must ensure that the grid provides affordable, reliable, and resilient electricity on a daily basis. As a matter of both national and economic security, the electric grid must have the resiliency to respond to extreme circumstances.

Fuel-secure baseload generators, primarily coal and nuclear, are under duress. An alarming number of coal and nuclear plants have closed prematurely and more are closing at a fast rate. This is especially true in the competitive, so-called merchant markets. The rate of plant closures has a compounding effect on grid resiliency – the ability to operate through an emergency or extreme conditions – by placing undue risk of severe consequences on the system.

Our nation's nuclear and coal plants are predominantly immune to short-term fuel supply disruptions, which makes them resilient. Evidence of how integral they are to the U.S. was demonstrated in 2014 when the Polar Vortex overstressed the grid, and many generation sources were unable to respond to power needs because of fuel supply disruptions. When the grid in much of the U.S. narrowly avoided operational failure, it was fuel-secure baseload power plants and not variable sources of electricity or those with interruptible fuel supplies that provided a resilient source of electricity.

A major factor putting coal and nuclear plants at a disadvantage are federal and state subsidies to intermittent power providers, making them artificially competitive. Additionally, government mandates for purchases of certain forms of electricity and excessive regulations on nuclear and coal providers negatively impact those resources' cost competitiveness. Adding to those headwinds, grid operators (Regional Transmission Organizations – RTOs) fail to create market rules that fairly compensate fuel-secure baseload generators for the resiliency they provide the grid. Coal and nuclear generators

maintain adequate fuel on-site to ride through an extended emergency, and do so without being compensated for that.

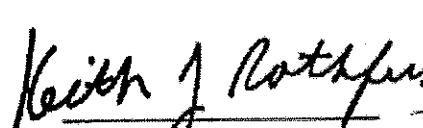

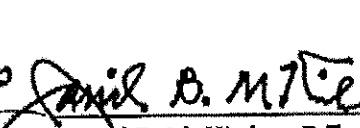

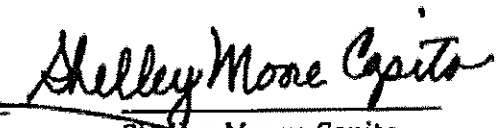

Beyond the risk injected into the electric grid carried over from the previous administration, there are national economic concerns at play too. If anti-resiliency bias within the RTOs' pricing models persists, thousands of workers and their families will be negatively affected. For generations, nuclear and coal have provided well-paying jobs in communities across America. Further plant closures will have huge negative economic effects, rippling across entire regions and drive up electric prices for ratepayers. Without your immediate help, these industries will not be able to provide the good jobs and the resilient electricity supply our nation currently has.

Mr. President, we are asking you to safeguard the grid's fuel security and direct the Secretary of Energy to exercise his Section 202(c) emergency powers under the Federal Power Act. We also request the Department of Energy evaluate the announced and expected retirement of additional fuel-secure baseload generation units and the potential national security and economic ramifications. Gambling with the resiliency of the electric grid is unnecessary and puts the safety of all Americans at risk.

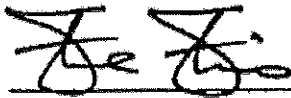

We applaud the extraordinary efforts you have already made to help turn our nation's struggling economy around, especially for middleclass workers. We hope that you will recognize the immediate severity of this issue and will take appropriate action to safeguard the electric grid's resiliency.

Thank you for your leadership, and your efforts to ensure that our nation has a safe and resilient electric grid.

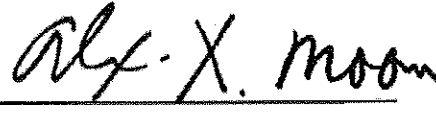

Sincerely,

April 26, 2018

The Honorable Donald J. Trump
President of the United States
The White House
1600 Pennsylvania Avenue, NW
Washington DC 20500

Dear Mr. President,

We write to reiterate an immediate concern about our nation's electric grid. This letter is an addendum to the correspondence sent to you February 21st about national security concerns relating to the electric grid's resiliency.

On January 21, 2018, New England's electric transmission system operator, ISO New England (ISO-NE), released an Operational Fuel-Security Analysis. The analysis cites significant concerns not merely with grid resiliency, but also with reliability. On page 4 it states that "fuel-security risk – the possibility that plants won't have or be able to get the fuel they need to run, particularly in winter – is the foremost challenge to a reliable grid in New England."¹ It goes on to assert that "the retirements of coal-fired, oil-fired, and nuclear generators – resources with fuel stored on site – will have a significant impact on reliability and magnify the importance of other variables, particularly liquefied natural gas (LNG) supplies."²

The analysis reports on page 53 that "fuel-security risks are present in the vast majority of cases, even in scenarios with higher LNG, renewables, and imports." These are striking admissions in an overall alarming report warning of increased risk of rolling blackouts.³

Mere days after ISO-NE released its analysis, various media outlets reported that the nation's first ever shipment of *Russian-sourced* LNG docked in Boston to relieve New England of an energy shortage. It is unconscionable that any part of our nation needs to purchase energy from a hostile nation in order to keep homes warm and the lights on. The U.S. has long pursued a policy of energy independence precisely because it is a national security issue. This threat is real and growing every day because of short-sighted policy driving domestic fuel-secure baseload generators offline and out of the marketplace.

¹ ISO New England, *Operational Fuel-Security Analysis* (January 17, 2018), available at http://www.iso-ne.com/static-assets/documents/2018/01/20180117_operational_fuel-security_analysis.pdf

² *Id.*

³ *Id.* at 53.

Furthermore, the Department of Energy's National Energy Technology Laboratory (NETL) examined the wave of premature baseload plant closures in a March 13, 2018 report. NETL studied the Bomb Cyclone that plunged many parts of the nation into a deep freeze from December 27 through January 8. On page 3, the report states that "during the worst of the storm from January 5-6, 2018, actual market experience demonstrated that without the resilience of coal – and fuel oil/dual-firing plants – its ability to add 24-hour baseload capacity – the eastern United States would have suffered severe electricity shortages, likely leading to widespread blackouts."⁴ Regarding the PJM Interconnection on page 17, it states that "had coal been removed, a 9-18 GW [gigawatt] capacity shortfall would have developed, depending on assumed imports and generation outages, leading to a system collapse."⁵

Only days ago on March 29th, FirstEnergy Solutions, one of the largest generators of electricity to PJM, filed notices with federal officials of intentions to close three nuclear plants. These notices preceded the company filing for Chapter 11 Restructuring on March 31st. This significant news is yet another hit to the grid's resiliency and our national security.

Mr. President, please protect our nation from such premature plant closures, as well as the dangers posed by hostile nations having influence on the US electric grid.

The following members support the continued request for the Secretary of Energy to exercise his Section 202(c) emergency powers under the Federal Power Act or any other applicable statutory authority.

We continue to thank you for your efforts to keep our nation and electric grid safe and resilient.

Sincerely,

Keith J. Rothfus

From: Will Campbell
To: AskOE
Subject: First Energy and 202c
Date: Friday, April 27, 2018 2:18:58 PM

As a consumer, electrical user- and voter- in an area that First Energy's 202c petition covers, I want to express my disappointment with the DOE, and President Trump (assuming he goes along with this) for even considering their request, as it not only has no merit on it's face, but has already been rejected in a similar form by the FERC.

First Energy and their failed business decisions need to be tested by the market, and not rescued by improper, and possibly illegal, use of section 202© of the Federal Power Act.

We are not on a wartime footing, we don't have a capacity problem, and there is no other rational reason to rescue a company and their soon-to-be stranded assets.

Bailing out a private company at taxpayer expense for no good reason except politics is the modern definition of corruption. Please re-read the FERC decision on a similar request by First Energy and understand why they rejected a similar proposal.

Thank you,
Will Campbell

October 20, 2017

Chairman Neil Chatterjee
Commissioner Cheryl A. LaFleur
Commissioner Robert F. Powelson
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Dear Chairman Chatterjee, Commissioner LaFleur, and Commissioner Powelson,

We write to thank the Department of Energy and Federal Energy Regulatory Commission (FERC) for initiating a rulemaking to help ensure a secure, resilient, and reliable U.S. electrical system. This will be accomplished by preserving the baseload power plants that form the backbone of our electric grid.

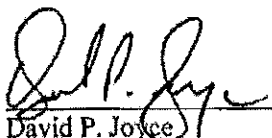

Our nation depends on an affordable, reliable, and secure supply of electricity produced by diverse energy resources. Baseload power plants are the only resources that can operate around the clock to support the energy demands of customers, businesses, and industries. These plants operate in all types of weather, and because they maintain large reserves of on-site fuel, they are not sensitive to fuel supply disruptions.

Preserving baseload plants also promotes a strong American economy. These facilities are economic engines that provide thousands of jobs not only at generating facilities and throughout the supply chain, but also in the small businesses, restaurants, entertainment venues, and other industries that comprise the communities around these plants. Local schools, police and fire departments, and other vital community services rely heavily on tax revenues paid by these facilities.

The current market structure, which undervalues baseload generation, has led to these plants closing prematurely at an alarming rate. These closures have resulted in an electrical grid with weakened resiliency and a diminished ability to respond to crisis.

A logical way to address this issue is to develop and implement market rules that appropriately compensate fuel-secure baseload generating plants. America's energy future depends on preserving a diverse, resilient, dependable, and secure energy supply. We appreciate your commitment on this matter and respectfully urge your swift action to develop and implement market rules that will prevent premature baseload plant closures, consistent with the rules and regulations of the Commission.

Respectfully,

David P. Joyce

Washington, DC 20005-2100

(202) 628-8200

April 27, 2018

The Honorable James Richard Perry
Secretary of Energy
United States Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Secretary Perry:

This letter builds on the joint filing dated March 30, 2018, that the Electric Power Supply Association (EPSA) co-signed with ten other entities in response to the application filed by FirstEnergy Solutions for an emergency order under section 202(c) of the Federal Power Act, and EPSA's subsequent letter to President Trump dated April 12, 2018.

More recently, press reports indicate that the Administration is also reviewing potential statutory authorities under the Defense Production Act to subsidize certain existing coal and nuclear plants with which EPSA members compete in the PJM Interconnection regional grid that operates federally regulated wholesale power markets. Furthermore, EPSA understands that the Department also may be considering Section 215A of the Federal Power Act as added by the FAST Act which provides new authorities intended to be used to address cyber security emergencies.

Reliability and resilience in PJM and other regions with organized wholesale markets depend on financially viable power plants using the full range of fuels and technologies. The power plants that together comprise the bulk power system in these regions are operated by several different types of owners, including independent power producers that EPSA represents, not just those utility-affiliated generators seeking one-off, narrow subsidies for themselves.

Viewing the complex, inter-related power grid solely through the narrow and parochial lens of subsidy requests from individual market participants, such as FirstEnergy Solutions, or categories of fuels, such as coal and nuclear, will make wholesale markets worse off, not better. This is especially so given that all power suppliers face a range of challenges. The policy choices facing the Administration should not be limited to either the status quo or even more subsidies. Subsidies are contagious. As the market share subject to competition continues to shrink from fuel-based preferences, both federal and state, there will be woefully insufficient megawatts to compete for by those not subsidized. At that point, everyone will require non-market payments. Thus, the policy choices the Administration is examining should also include the best choice, which is eliminating discriminatory and fuel-specific "thumbs on the scale" for electricity.

The Department's policy review should not be based on statutes such as FPA Section 202(c), the Defense Production Act, and Section 215A of the Federal Power Act (FAST Act) that were never intended to be used to establish economic support arrangements for entire sub-categories of generating facilities. By limiting its review in this fashion, the Department is unnecessarily confining itself to adding yet another thumb on the scale by creating a new broad federal subsidy program. While some may view this as rebalancing what was done by the prior Administration, that simply invites others to engage in further rebalancing in the future. Such uncertainty is inherently inconsistent with making substantial investments at market risk in long-lived assets to achieve your goal of improving electricity infrastructure for the future.

The Department should not miss this historic opportunity to promote competition and open markets. Effective competition will achieve the type of secure, reliable and resilient "all-of-the-above" mix of generating facilities the Administration seeks. To this end, EPSC suggests a bold and courageous approach that reduces and then removes subsidized forms of generation from distorting competitive generation markets. This can be achieved on parallel paths:

- The Department of Energy should lead an effort to review all existing subsidies related to power generation and, to the extent it is determined that such subsidies are no longer needed or effective, work with Congress and other relevant federal agencies to eliminate those that distort markets; and,
- The Federal Energy Regulatory Commission should swiftly conclude several pending dockets through which the Commission must develop and implement effective rules to protect competitive wholesale power markets from the parasitic and distorting effects of material discriminatory subsidies, both federal and state, whether supply-side or on the demand side of the electric meter.

The focus among many federal and state energy regulators over the last several decades has been to work to transition an industry once focused almost exclusively on extensive regulation and cost-of-service reimbursement to an industry that values competition over regulation and depends on market forces to incentivize both new investment and market participant behaviors that maximize system reliability.

We have learned a lot from these efforts. First and foremost, **markets work** and, when impediments and distortions are removed from markets, **they work better**. The second thing we have learned is that, when there are concerns that the markets are not creating adequate incentives to build or retain generating units that have the attributes that the power system needs to be reliable and resilient, the best way to address those needs is through new market-based initiatives that are **fuel neutral**. For example, new products and a full suite of attributes can be introduced into the existing markets (like PJM's capacity performance product) and generating facilities can then compete to provide these products and **all** required attributes in cost-effective and innovative ways.

The approach EPSA is recommending does not prevent States from making their own resource decisions, one way or the other. If a State wishes to incentivize or provide cost support for a specific type of generation, it will continue to be completely free to do so. But, it is essential to also respect the choices made by those States that elect not to subsidize specific resource types. Thus, regardless of the State in which they are located, those generating facilities that have not been subsidized must be protected from the market distortions that occur when subsidized resources are permitted to participate in the wholesale markets without limits. Absent adoption of effective countermeasures to protect the integrity of the wholesale power markets that FERC regulates, the subsidized subset of competitors will have an unfair artificial advantage competing with unsubsidized resources to clear wholesale energy and capacity markets on which the unsubsidized resources totally rely for revenues to remain viable.

Similarly, if in the future the Department determines that specific energy assets need emergency support for identified national security reasons, any temporary cost reimbursement that is provided to the relevant asset owners needs to occur outside of these markets, so that un-subsidized resources and their customers do not bear the brunt of providing funding for what will be an emergency or national security issue.

We think the choice is clear. Removing market distortions and ensuring that the power plant attributes that the system needs are compensated within the market on a competitive basis will allow an all-of-the-above strategy to continue to be successful. Doing so will ensure that it works into the future in a manner that incentivizes and spurs new investment and innovation along the way.

We look forward to working with you in addressing the Department's very important goals for the nation's energy systems including its organized wholesale power markets.

Sincerely,

John E. Shelk
President & CEO
Electric Power Supply Association (EPSA)

RE: Federal Power Act section 202(c)

ExxonMobil Power and Gas Services Inc., an affiliate of Exxon Mobil Corporation, and ExxonMobil Gas and Power Marketing Company, a division of Exxon Mobil Corporation, appreciates the opportunity to submit these comments to the Department of Energy.

Exxon Mobil Corporation, collectively with its affiliates (ExxonMobil), constitute one of the largest U.S. suppliers of natural gas, as well as a major purchaser of electricity for its own operations. The energy we produce and the products we refine underpin the nation's economic prosperity, security, and the lifestyles American citizens enjoy. We have a long history of working with federal, state and local governments during times of emergency to ensure economic, commercial and individual recovery occurs as quickly as possible and that government priorities are swiftly addressed.

We not only oppose FirstEnergy Solutions Corporation's proposal to request invocation of governmental emergency authority in order to address its business situation ("Proposal"), but also are disappointed that an energy company would file such a request. There is no emergency facing the U.S. power grid or industry. Invocation of emergency authorities as requested would establish a troubling precedent for the future as the U.S. energy system continues to evolve.

The main arguments against the invocation of section 202(c) authority – or any other governmental emergency authority – are provided below. Additional details are provided in the filings of the American Petroleum Institute and the Natural Gas Supply Association, whose comments we support.

- No emergency exists. Numerous reports, including one by the EIA as well as comments by the grid operators, confirm that fact. Any concerns about prospective grid emergency scenarios, including cybersecurity, are best addressed by engaging with the operators as well as FERC. The market is evolving naturally by welcoming modern, efficient, flexible generation sources.
- Grid resilience and fuel diversity are complex issues which are being actively worked by subject matter experts with a stake in the outcome. Artificially retaining uncompetitive power sources is an overly simplified and ineffective response, whether those sources are coal, nuclear, gas, or renewables. The market should provide the opportunity for generation sources to compete based on their inherent capabilities, limitations, and long-term economics.

- Well-functioning markets are the best means for achieving the optimal blend of resilience, fuel diversity, and affordability. While electricity markets are not perfectly competitive, they have clearly and intentionally moved in that direction in recent decades. However, adding distortions on top of existing distortions would reverse that trend, and create economic uncertainty for current and potential future investments in the market. It would also tip the scales against technical innovation and market flexibility.
- Electricity consumers, from homeowners to small businesses to large industrial operators, would be harmed by higher electricity prices. Their voice has largely been lost in the current debate – the media tends to focus on bankruptcies and lobbying campaigns by companies and creditors – as has the adverse economic impact that would result from actions on the Proposal or similar federal interventions. These factors should be carefully considered before any action is taken.

In summary, the recently-announced retirements of several coal and nuclear plants is not creating an emergency in the electricity industry. Undertaking emergency action in the present context would cause numerous adverse consequences for essentially all participants in the electricity market, from generators to end consumers, and be contrary to market principles.

The President and Secretary have considerable authority to act in the event of a true emergency, and that authority should be constrained to and reserved for those limited circumstances. As noted, ExxonMobil stands ready to assist during those times.

We therefore urge that FirstEnergy's extraordinary request for the invocation of federal emergency powers be rejected, along with any similar options being considered, and that FERC be allowed to continue with its deliberate and thoughtful approach toward examining and addressing grid resiliency issues. FERC's approach is the established means to engage with industry to improve the grid and the power markets, and to continue to enhance U.S. competitiveness and security.

Sincerely,

Paul Greenwood

President

VIA EMAIL

Mr. Michael Catanzaro,
Special Assistant to the President, Domestic Energy and Environmental Policy
The White House
1600 Pennsylvania Ave. NW
Washington, DC 20500

Re: FirstEnergy Solutions Corp.'s Request for Emergency Action

Dear Mr. Catanzaro,

I am writing you on behalf of the Indiana Industrial Energy Consumers, Inc. ("INDIEC"), regarding *FirstEnergy Solutions Corp.'s Request for Emergency Order Pursuant to Federal Power Act Section 202(c)1* ("Request") to the Secretary of the Department of Energy ("DOE") submitted on March 29, 2018.

INDIEC is an association of large energy users in the state of Indiana with an annual energy spend of \$894,000,000 and employing over 59,000 people. As such, the cost of energy is of major importance to the continued success of their industrial operations and INDIEC members have a substantial interest in keeping those energy costs as low as possible. Consequently, INDIEC is very concerned with FirstEnergy's Request because it will undermine the competitive market that exists in PJM and result in raising energy cost throughout the PJM footprint.¹ INDIEC is also concerned that granting FirstEnergy's Request will impact the MISO market and other RTO's as well.

FirstEnergy's Request is premised on the erroneous notion that the proposed future retirement of three of FirstEnergy's facilities will undermine the reliability of the grid as a whole. There is no support for this allegation and, in fact, PJM is on record as stating that there is no immediate threat to system reliability.² Rather, the proposed retirements are the result of appropriate price signals reflecting that more expensive generation is being replaced by less expensive generation. This is how the markets should work.

¹ INDIEC joined in the protest of the PJM Consumer Representatives submitted April 5, 2018 to DOE.

² Letter of PJM Interconnection LLC to Secretary Perry dated March 30, 2018.

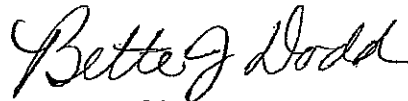

FERC received extensive comments from PJM and other stakeholders in response to the Secretary's proposed grid resilience pricing rule, which addressed most of the same arguments in FirstEnergy's Request. FERC found that the pricing relief requested was not justified.³ Instead, FERC has begun proceedings to provide further analysis of the issues raised by the proposed rule.⁴ FirstEnergy's Request is an attempted end run around FERC's January 8th Order.

Moreover, FirstEnergy's Request has not demonstrated an emergency exists. DOE regulations clearly state that economic factors relating to service are not considered emergencies unless there is an imminent inability to supply electric service. Consequently, FirstEnergy has failed to meet even the first criteria for seeking emergency relief, much less demonstrating that a reliability emergency exists.

Indiana is a manufacturing intensive state. Industrial operations in Indiana are already facing continued rising energy costs. Granting FirstEnergy's Request and forcing the PJM market to subsidize unproductive, noncompetitive generation facilities adds to rising energy costs and provides a disruption of the competitive wholesale markets. The long-term effect of granting FirstEnergy's Request would undermine the public's confidence in the markets. Further, if FirstEnergy's Request is granted, it could provide a precedent for other utilities to follow in other wholesale markets such as MISO, undermining all RTO markets.

For all of the above stated reasons, INDIEC requests that the Administration reject FirstEnergy's Section 202(c)1 Request and decline to take other action to interfere with retiring power plants.

Respectfully submitted,

Bette J. Dodd

Date: Friday, April 27, 2018 10:47:00 PM

Dear Sirs:

FirstEnergy's 202(c) request for a federal bailout is un-American. They have made loads of money by providing energy when we didn't know how to do it any other way. They made bad decisions for the future of their business. The American people don't owe them a pass for their bad decisions. They need to be allowed to go bankrupt as they deserve due to their bad decisions.

Best Regards,

Richard Miller

The Honorable James Richard Perry
Secretary of the Energy
United States Department of Energy
1000 Independence Ave, SW
Washington, DC 20585

Re: First Energy Solutions, Corp. Request for Emergency Order Pursuant to Federal Power Act Section 202(c) Submitted March 29, 2018

Dear Secretary Perry:

PJM Interconnection, L.L.C. ("PJM") respectfully submits to the Secretary of Energy (the "Secretary") additional new information to enhance the record and contribute the Secretary's understanding of the issues. This information supplements the Motion to Intervene and Limited Response filed by PJM on April 13, 2018 (the "Response").¹ PJM recognizes that fuel security raises questions about electric system resilience which go beyond reliability. Fuel security focuses on the risks of fuel supply and delivery to generators.

On April 30, 2018, PJM published "Valuing Fuel Security," setting forth the next steps of PJM's resilience initiative which is attached hereto and incorporated herein.² PJM is initiating a

¹ The Response included an attached report ("PJM's Report") giving PJM's perspective and response to a report issued by the National Energy Technology Laboratories ("NETL") on March 13, 2018 (the "NETL Report"). The PJM Report concluded that performance during the 2017/2018 cold snap is "evidence that the grid in the PJM service area remains strong, diverse and reliable." PJM Report page 10.

² *Valuing Fuel Security* found at: <http://www.pjm.com/-/media/library/reports-notice/special-reports/2018/20180430-valuing-fuel-security.ashx?la=en> ("Fuel Security Initiative").

process, starting immediately, to analyze fuel security vulnerabilities in an evolving generation fleet. The process will involve three phases:

- Identify system vulnerabilities and determine attributes such as on-site fuel requirements, dual fuel capability or others that ensure that peak demands can be met during extreme scenarios.
- Model those vulnerabilities as constraints in PJM's capacity market, similar to existing transmission constraints, allowing for proper valuation of needed attributes in the market.
- PJM would work with the U.S. Department of Homeland Security, the U.S. Department of Energy, the Federal Energy Regulatory Commission, states, stakeholders and others to ensure that the results are consistent with identified security needs in the PJM footprint, including service to key military installations and other identified security concerns.

PJM actively participated in the proceedings before the Federal Energy Regulatory Commission (the "Commission") on grid resilience. In response to the Secretary's proposed rule for final action,³ PJM submitted initial comments on October 23, 2017,⁴ and reply comments on November 7, 2017,⁵ in Commission Docket No. RM18-1-000 regarding the Secretary's proposal, both of which are incorporated herein by reference.

Then in response to the Commission's January 8, 2018, Order Terminating Rulemaking Proceeding, Initiating New Proceeding, and Establishing Additional Procedures,⁶ PJM submitted comments in response to the Grid Resilience Order which are incorporated by reference herein.⁷

³ The full text of the Secretary's proposal can be found at: <https://energy.gov/downloads/notice-proposed-rulemaking-grid-resiliency-pricing-rule>.

⁴ *Initial Comments of PJM Interconnection, L.L.C. on the United States Department of Energy Proposed Rule* found at: https://elibrary.ferc.gov/idmws/file_list.asp?document_id=14612546 ("Initial Comments").

⁵ *Reply Comments of PJM Interconnection, L.L.C. on the United States Department of Energy Proposed Rule* found at: https://elibrary.ferc.gov/idmws/file_list.asp?document_id=14617934 ("Reply Comments").

⁶ *Grid Resilience in Regional Transmission Organizations and Independent System Operators*, 162 FERC ¶ 61,012 (2018) ("Grid Resilience Order"). In the Grid Resilience Order the Commission (1) terminated the proceeding regarding the proposed rule on Grid Reliability and Resilience Pricing submitted to the Commission by the Secretary that was focused on providing cost-of-service compensation to generators with on-site fuel capability, and (2) initiated a new proceeding under Docket No. AD-7-000 on Grid Resilience in Regional Transmission Organizations and Independent System Operators. The Grid Resilience Order directed each Regional Transmission

The Fuel Security Initiative builds off of PJM's published analysis of the reliability attributes associated with various potential future resource mixes.⁸ In the Fuel Report, PJM's analysis concluded that its bulk electric system could be operated reliably under an array of future supply portfolios. PJM is continuing now expeditiously to ensure fuel security as outlined in the Fuel Security Initiative.

In addition, PJM organized and sponsored two well-attended Grid 20/20 events, one on fuel diversity and resilience⁹ and the other on grid security and resilience.¹⁰ The April 2017 Grid 20/20 event facilitated a stakeholder discussion on fuel mix diversity and security issues and their intersection with resilience.

Finally, PJM has completed the 30-day analysis of the deactivation notice dated March 28, 2018, which PJM received from FirstEnergy Solutions Corp. on behalf of FirstEnergy Nuclear Generation, LLC (together referred to as "FirstEnergy Solutions") notifying PJM in the intent to deactivate certain nuclear units pursuant to PJM Open Access Transmission Tariff ("PJM Tariff"). In accordance with PJM Tariff, section 113.2, PJM notified FirstEnergy

Organization ("RTO") and Independent System Operator ("ISO"), including PJM, to submit initial comments and responses to the Commission on resilience in order to enable the Commission to holistically examine the resilience of the bulk power system.

⁷ *Comments and Responses of PJM Interconnection, L.L.C.* incorporated by reference and found at: https://elibrary.ferc.gov/idmws/file_list.asp?document_id=14648921 ("PJM March 9 Comments").

⁸ *PJM's Evolving Resource Mix and System Reliability* (March 30, 2017) incorporated by reference and found at: <http://www.pjm.com/-/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.Ashx?la=en> ("Fuel Report"); PJM, *Appendix to PJM's Evolving Resource Mix and System Reliability* (March 30, 2017), <http://www.pjm.com/-/media/library/reports-notices/special-reports/20170330-appendix-to-pjms-evolving-resource-mix-and-system-reliability.ashx?la=en>.

⁹ See Grid 20/20: Focus on Resilience (Fuel Mix Diversity & Security), April 19, 2017 ("April 2017 Grid 20/20"), <http://www.pjm.com/committees-and-groups/stakeholder-meetings/symposiums-forums/grid-2020-focus-on-resilience-part-1-fuel-mix-diversity-and-security.aspx>.

¹⁰ See Grid 20/20: Focus on Security & Resilience, September 19, 2017 ("September 2017 Grid 20/20") incorporated by reference and found at: <http://www.pjm.com/committees-and-groups/stakeholder-meetings/symposiums-forums/grid-2020-focus-on-security-and-resilience.aspx>.

Solutions that the deactivation of these generating units is not expected to adversely affect the reliability of the PJM Transmission System due to a combination of remedial measures, including (i) accelerating the completion of existing baseline upgrades included in the Regional Transmission Expansion Plan ("RTEP upgrades"), (ii) timely completion of new RTEP upgrades, and (iii) implementing system redispatch measures. With these measures, the PJM Transmission system will remain reliable, and therefore the generating units listed above may plan to deactivate as scheduled, based upon the identified remedial measures. PJM posted additional information on the deactivation analysis for the subject nuclear generator units for the May 3, 2018 Transmission Expansion Advisory Committee which are incorporated herein by reference.¹¹

PJM respectfully submits that the forgoing information and documents incorporated by reference will help clarify the record in this proceeding and contribute the Secretary's understanding of the issues.

Respectfully submitted,

/s/ Steven R. Pincus

Introduction

Resilience describes a broad array of low-probability but high-impact risks at all stages of the production, transmission and distribution of electricity. PJM Interconnection is uniquely positioned to see the bigger picture of the many factors that affect the resilience of the grid. PJM now seeks to isolate one type of resilience risk: fuel security. Fuel security focuses on the vulnerability of fuel supply and delivery to generators and the risks inherent in increased dependence on a single fuel-delivery system.

In March 2017, PJM published an analysis of the reliability attributes associated with various potential future resource mixes.¹ PJM's analysis concluded that its bulk electric system could be operated reliably under an array of future supply portfolios. However, the scope of the analysis did not include the resilience of the system with various potential portfolios nor the risks associated with significant disruptive events.

As the paper noted: "Heavy reliance on one resource type, such as a resource portfolio composed of 86 percent natural gas-fired resources, however, raises questions about electric system resilience, which are beyond the reliability questions this paper sought to address."

As is the case with reliability standards, PJM believes the most effective way to address fuel security is to define and establish fuel security criteria and then use market forces to allow all resources to compete to meet those criteria. The PJM markets can provide excellent, fuel-neutral tools to value identified and verified fuel security attributes. Additionally, the PJM markets offer a competitive environment to deliver fuel-secure electricity in the most efficient and cost-effective manner to customers. The market can also send a price signal that works to incent investment in fuel-secure infrastructure.

This market signal can be used as one data point to assist in valuing various alternatives such as the benefits of new pipelines, the benefits of resources with on-site fuel and the value of new technologies that promote an array of fuel-secure resources. Market participants would respond to the signal with the most cost-efficient approach to ensure fuel security. **The market-based approach outlined below can work to achieve a cost-effective, fuel-secure fleet of resources.**

As defined by PJM, fuel security is the ability of the system's supply portfolio, given its fuel supply dependencies, to continue serving electricity demand through credible disturbance events, such as coordinated physical or cyber-attacks or extreme weather that could lead to disruptions in fuel delivery systems, which would impact the availability of generation over extended periods of time. To define potential fuel-security criteria, PJM needs to understand the fuel-supply risks in an environment trending towards greater reliance on natural gas supply and delivery.

The goal is to identify triggering thresholds (such as a simulated loss of load) that indicate locations on the system where additional fuel security assurance is needed. PJM could then model those locations as constraints in the capacity market, just as PJM models transmission constraints today when determining the parameters that form the locational requirements in the capacity auction. As with transmission constraints, modeling fuel security would only

¹ <http://pjm.com/-/media/library/reports-notice/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx?la=en>

result in price separation if the results demonstrate a constraint. Ideally, if analysis indicates the need for constraints, PJM would implement them by the May 2019 Base Residual Auction.

As a first step, PJM will perform targeted analyses to identify fuel security risks that could affect specific locations on the system (or depending on the nature of the fuel supply risk on the aggregate PJM system) and establish criteria to apply to existing market mechanisms in order to produce efficient and cost-effective results for customers. This document outlines the objectives for this study, defines the approach fundamentals, including assumptions, and establishes the timeline for completion.

Proposed Approach

PJM recognizes that assessing fuel security is complex and best tackled in phases. The first phase is to assess, via analysis, the scope of fuel security vulnerabilities and the development of criteria. The following phases would use the results of the first phase as input to determine the valuation of fuel security attributes. PJM anticipates overlap between phases as it continues to refine the analysis, criteria and methods for valuing fuel security.

Phase I: Analysis – Identify potential system vulnerabilities on a locational basis and develop fuel security criteria to address those vulnerabilities.

Phase I is intended to identify potential system vulnerabilities and to determine attributes such as requirements for amounts of on-site fuel and dual-fuel capability, among others, to ensure that peak demands can be met during realistic but extreme contingency scenarios in various supply portfolios.

As PJM concluded in its March 2017 report, PJM's current fuel portfolio is reliable, diverse and among the highest performing of those studied. It is well supplied with the required generator reliability attributes. The PJM system can remain reliable with the addition of more natural gas and renewable resources. However, an increased reliance on any one resource type introduces potential fuel security risks not recognized under existing reliability standards.

Such risks could include the deliverability logistics of fuel supplies during stressed conditions over time as opposed to more momentary interruptions that otherwise are considered through the procurement of reserves. The intent of Phase I will be to stress-test the system under various extended fuel supply disruption scenarios in order to better understand reliability outcomes resulting from the current capability of local onsite fuel and back-up fuel.

This is different from the objective of the Capacity Performance enhancements already implemented in the PJM capacity market. Capacity Performance ensures that individual resources are prepared to perform when the system needs them the most. The vulnerabilities that the Phase I analysis will identify and model as constraints may be beyond the ability of any individual unit owner to control through more secure fuel contracts or investment in particular units.

Phase II: Modeling – Work through the PJM stakeholder process to incorporate vulnerabilities, on a locational basis, as constraints in PJM's capacity market (similar to PJM's modeling of transmission constraints today).

This would allow for the proper valuation of needed locational attributes as well as competition among resources that today or in the future can provide those attributes to ensure a resilient grid. The results of the Phase I analysis will be used in Phase II to help model constraints as part of the planning parameters in PJM's capacity market to help identify and value needed fuel security attributes at particular locations on the system.

Recognizing that the PJM region is large and diverse, generation located, for example, on top of a Marcellus shale field does not face the same fuel security issues as a generator more distant from supply and connected to a lateral pipeline served by a single natural gas distribution company. Similarly, delivery mechanisms for coal and oil differ across the region. For these reasons, PJM recommends starting with a locational analysis focused on specific fuel delivery vulnerabilities, which will differ depending on geography. These constraints would then be modeled in the capacity market along with existing and projected transmission constraints to ensure that each zone and sub-zone in PJM is able to maintain reliable service during a disruptive event that could last several days. As with transmission constraints, modeling fuel security would only result in price separation if the results demonstrate a constraint.

Phase III: Ongoing Coordination – Address any specific security concerns identified by federal and state agencies such as physical and cybersecurity hardening of critical assets that are cleared in the market.

In Phase III, PJM would work with the U.S. Department of Homeland Security, the U.S. Department of Energy, the Federal Energy Regulatory Commission, states, stakeholders and others to ensure that the results are consistent with identified security needs in the PJM footprint, including service to key military installations and other identified security concerns. Further, those facilities that clear as fuel-secure resources in the capacity market would need to assure regulators that they are “hardened” to address identified physical and cybersecurity threats and that the fuel system upon which those resources depend are similarly able to withstand identified physical and cybersecurity threats.

Assumptions

The following are a few high-level indicative assumptions that could be utilized for the analysis in Phase I:

- Generator forced, planned and maintenance outage rates (other than outages related to fuel supply) will be consistent with recent winters
- Oil-fired and dual-fuel generator withdrawals of oil and ease of replenishment will be modeled on a locational basis, taking into account the locational supply chain and contractual arrangements associated with such replenishments. PJM will study several different capacity supply portfolios under multiple different gas-availability scenarios.

- The study will be simulated under 2017-18 Cold Snap extended cold weather conditions and under 2014 Polar Vortex loads and wind chill levels.²
- The study will be conducted for the RTO region and sub-regions.

Analysis Scenarios

PJM will create several capacity portfolio scenarios for the purposes of the study. They include:

- **Base Portfolio:** This scenario includes the 2020-21 PJM resource portfolio with scheduled retirements in addition to other retirements in order to have the Installed Reserve Margin (IRM) equal the approved value of the 2017 PJM Reserve Requirement Study of 16.6 percent.³
- **Stressed Portfolio:** This scenario includes the base portfolio scenario along with additional coal and nuclear retirements.
- **High-Stressed Portfolio:** This scenario includes the base scenario along with an assumption that an increased percent of coal and nuclear are retired and replaced with natural gas within the same zone as the retired resources.

Disruptions

PJM will simulate disruptions to fuel delivery systems that could be the result of credible extreme events such as coordinated physical or cyber-attacks, extreme weather, etc. The following is a description of the disruption scenarios:

- No disruptions; generators have access to supply throughout the winter, subject to current pipeline capacity.
- Reduction of a realistic percentage of delivery capability on particular constrained portions of pipelines in the PJM region. This would address the potential for a significant disruptive event to degrade the pipelines' ability to deliver to a set of generating units.
- In addition to reduced supply availability over longer periods, study a few realistic but extreme contingencies such as a *force majeure* event on key delivery facilities.
- In addition to reduced gas availability, analyze other fuel supply disruptions.

Each of these disruptions will be applied to the three capacity portfolio scenarios described above.

² <http://www.pjm.com/-/media/library/reports-notice/weather-related/20180226-january-2018-cold-weather-event-report.ashx>

³ <http://www.pjm.com/-/media/committees-groups/committees/pcl/20171012/20171012-item-03a-2017-pjm-reserve-requirement-study.ashx>

Anticipated Outcome

PJM anticipates completing the study within the next several months. The results will be discussed with PJM stakeholders and state and federal agencies.

PJM intends to use the study results to define (if analysis indicates they are necessary) specific fuel-security criteria that could be implemented as constraints in the capacity market for application in the next possible Base Residual Auction. These constraints will be defined in a fuel-neutral manner, such that all resources are able to compete to meet them. Including such criteria in the capacity market modeling would ensure that the capacity market commits resources based on the least-cost set that ensures resource adequacy including fuel security considerations.

Approach Rationale

PJM believes the most effective way to address fuel security is to define and establish fuel security criteria and then use market forces to allow all resources to compete to meet those criteria. The competitive markets remain the best mechanism to use to meet the needs of maintaining a reliable and fuel-secure system at the lowest reasonable cost to consumers. Establishing the criteria and constraints proactively will allow them to be modeled in the capacity market before the PJM system is at a point where the constraints could be violated. By doing so, the market construct will be prepared and configured to recognize these constraints if and when they do arise, so that the market can commit resources on the basis of those constraints. Moreover, using the existing market constructs is expected to limit significantly the number of instances where out-of-market actions are necessary.

PJM looks forward to working with stakeholders, federal and state agencies on further developing the incorporation of fuel security criteria into its markets going forward.

Proposed Timeline

Acknowledging that valuing fuel security is a complex effort, the proposed approach attempts to organize the effort in incremental phases. The phases are not necessarily contemplated to be sequential and PJM acknowledges that there will be overlap between the phases as we collect feedback and work through the stakeholder process. PJM proposes the following timeline:

- Phase I, initial analysis, completed in 3-4 months
- Phase II completed in 4-5 months
- Phase III ongoing

These phases and timeframes will be fluid and dynamic. Ideally, if analysis indicates that fuel security constraints are necessary, they would be implemented by the May 2019 Base Residual Auction.

Stakeholder Feedback

PJM welcomes stakeholder feedback regarding the scope of this analysis. To that end, PJM will schedule a special MRC conference call in the near future to garner stakeholder feedback on this plan. Of course, protections, including those addressed through PJM Critical Electric Infrastructure Information rules, would be needed to shield the exact input and results of that modeling to prevent vulnerabilities from being publicly released. PJM is prepared to work with the Federal Energy Regulatory Commission and stakeholders to develop appropriate mechanisms to achieve appropriate transparency.

Date: Tuesday, May 01, 2018 12:02:37 PM

Conversion of nat gas generation because of cost and environmental considerations should include analysis of following.

[1] Generation using renewables of hydrogen which is then inserted in nat gas storage facility to make higher content BTU gas. Outcome is more efficient generation from nat gas facilities. Also provides use of off peak available power from renewables. These kinds of systems are being stood up in Canada and Gr and is cutting edge advantage increasing value of renewables and good solution for highest energy backup supplies

[2] Related issues is to encourage nat gas generator operators to add additional new tech CO2 capture systems on output. This could start move to 90% plus performance reductions regarding CO2 getting very near nuclear without the costs and lingering issues. This approach is very interesting for Ohio as the new gas generators are very near Utica and Marcellus producing wellheads and CO2 could easily be concentrated and injected back into field

[3] These are new tech suggestions but DOE/ PMJ analysis projecting out 2-5 years make all reasonable and decisions should provide path to encourage adoption rather than simply rely on low probability risk as excuse for maintaining high cost backups

Dear President Trump,

On behalf of the International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers (Boilermakers), I write to urge action by your administration, through the Department of Energy (DOE), to use emergency powers to avoid the imminent closure of critical coal and nuclear power plants. Hundreds of coal-fueled generating plants have closed over the past several years due to lower natural gas prices and stringent EPA regulations. Some nuclear units are at risk because they cannot recover their costs under current electricity market rules, leaving some states struggling to ensure their economic viability.

Recently, the Federal Energy Regulatory Commission (FERC) rejected a proposed rule by DOE to provide full cost recovery for coal and nuclear units operating in competitive power markets. This rule would have helped to ensure fuel diversity and resilience of the electric power grid by correcting competitive electricity markets in the way that power producers are compensated. DOE's proposed rule recognized that baseload coal and nuclear plants provide unique benefits to the electric grid due to the security of their "on the ground" fuel supplies and their inherent stability and reliability.

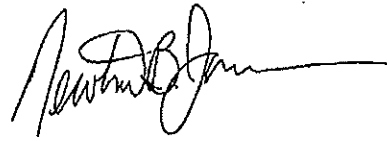

Unfortunately, the lack of action by FERC has now left too many of these coal and nuclear power plants vulnerable to imminent retirement. These plant closures will certainly result in further strain on the electric grid and reliability - not to mention the detrimental effects on the communities that these plants support through a strong tax base and steady employment, including thousands of highly-skilled Boilermakers who construct and maintain these coal and nuclear units.

Too many baseload power plants have already closed in recent years. The premature retirement of many more due to outdated market rules will further undermine electric reliability, affecting consumers, manufacturing industries, and high-tech businesses. Once these baseload power plants close, they do not reopen.

FERC's refusal to address this problem as proposed by DOE has left few alternatives and, in our view, requires immediate, corrective action by DOE.

I urge you to direct DOE Secretary Perry to use his emergency authority to intervene in this serious situation to prevent the further closure of coal and nuclear baseload generators.

Sincerely,

A handwritten signature in black ink, appearing to read "Newton B. Jones", with a long horizontal flourish extending to the right.

**Re: FirstEnergy Solutions Corp. March 29, 2018 Request for Emergency Order
Duquesne Light Company's Motion to Intervene**

Dear Secretary Perry, Assistant Secretary Walker, and Deputy Assistant Secretary Jereza:

It has come to Duquesne Light's attention that language in its "Motion to Intervene," filed April 11, 2018, may be misconstrued. To clarify, Duquesne Light did not intend to take a substantive position regarding FirstEnergy Solutions' 202(c) application at this time. Simply, Duquesne Light's position is that the company and its customers could experience reliability impacts and changes in energy, capacity and transmission costs by FirstEnergy Solutions' application, and requests full party rights to protect its interests.

Respectfully Submitted,

Document 132

President Donald J. Trump
The White House
1600 Pennsylvania Avenue NW
Washington, DC 20500

RE: Request for Emergency Order By FirstEnergy Solutions Corp. Under Federal Power
Act Section 202(c)

Dear Mr. President:

East Penn Manufacturing vigorously opposes FirstEnergy Solutions Corp.'s Request to the Department of Energy for issuance of an Emergency Order under Section 202(c) of the Federal Power Act.

Granting the Request would undermine the competitive forces at play in wholesale electricity markets and directly undercut the tremendous economic advantage of the Marcellus and Utica natural gas shale plays in the United States. American companies and consumers would be unnecessarily subjected to higher energy bills if the Request were to be granted.

East Penn Manufacturing has thirteen facilities in the PJM region. East Penn employs 7,427 and provides economic benefits to Illinois, Indiana, Kentucky, Maryland, Ohio, Pennsylvania, Virginia, and West Virginia and to America. Energy prices are a significant portion of East Penn Manufacturing operating costs. As you know, higher energy and regulatory costs threaten the competitiveness of American industries, manufacturers, producers, and large industrial users of energy like East Penn Manufacturing.

There is no looming emergency in the PJM region. Very healthy electricity capacity reserves are available throughout the region that is targeted by the Request. Mechanisms and standards are in place to ensure reliable delivery of electricity. Energy prices are currently reflecting lower prices for natural gas and other electric generation fuels. An emergency order from the Department of Energy would be unnecessary and unlawful.

If granted, FES's Request would unnecessarily raise energy prices for consumers and directly undercut the tremendous economic advantage of U.S. natural gas shale plays. Energy prices are currently reflecting lower fuel prices.

On behalf of East Penn Manufacturing, I strongly recommend that the Request be denied.

Respectfully,

Christy Weeber
Senior VP Finance
East Penn Manufacturing

(b) (6) Our country needs a Fully Diversified Energy Portfolio and National Energy Policy inclusive of Nuclear, Coal, Gas, Hydro, Wind, Solar, Energy Storage, and Other Renewables to be as strong and independent as we can be with respect to Reliability, Security, Economic Stability, Stewardship of our Resources for our children and their children and grandchildren, etc.. NG is a very precious and useful natural resource used as a primary feedstock in our chemical and manufacturing facilities, for power generation, and as a primary fuel to heat our homes, we need to continue to expand our NG exploration and use for sure, but treat it as so, and in addition not rely on it as our primary power generation source. I'm a proponent of all of the above fuel sources and technologies and our ability to advance their use responsibly, not picking ones over others but picking them all, and above all making them all work for us. So I ask you all involved in these very important policy decisions to not think small, think big picture.

From: Jim Trakas
To: AskOE
Subject: RE: Please Invoke Section 202 (C) for First Energy's Three Nuclear Power Plants
Date: Tuesday, May 01, 2018 12:34:36 PM

Dear Sir or Madam:

I write as the Public Utilities Chairman of the City of Independence, Ohio, a community that relies upon stable power supply from its energy suppliers, including First Energy, whom had once been headquartered in our community. I ask that the Secretary of Energy invoke Section 202 (C) to save our nuclear power plants that provide security and stability to Ohio and Pennsylvania consumers.

For several reasons, the extraordinary power associated with Section 202 (C) should be invoked:

1. I fear that shuttered nuclear power plants are a safety risk and an appetizing target for terrorism, which would meet the national security definition associated with a 202 (C) action. Many credible threats have come in as to terrorists wishing to attack America, either from within or overseas threats. Having three shuttered nuclear plants in this region make for ripe targets of opportunity, and we should not afford terrorists those opportunities.

We know that Al Queda, ISIS, and other Moslem terrorists have targeted nuclear power plants. President George W. Bush stated the threat in 2002, and that U.S. intelligence found diagrams of U.S.A. nuclear power plants in Afghanistan. Terrorists in Belgium were plotting an attack on a nuclear power plant.

Due to good intelligence and vigilance, these attacks were thwarted, but should we actually shut down plants, it makes them even more vulnerable to attack and opens our region up to a ripe target, something that should be avoided from a national security perspective.

2. The United States of America continues to be at war with terrorists, foreign and domestic since 14 SEP 01, under Public Law 107-40, which is still in affect. (b) (6)

unit drills monthly to assist civilian authority in case of attack. Forces of the United States of America are deployed all around the globe, but particularly in Afghanistan, where threats to America's nuclear power plants have been evidenced and continue to be evidenced. Our enemies are constantly plotting the demise of the nation during the Global War on Terror, and the authorization of force granted President Bush and his successors, are still in force. We are in a state of war against terrorists, and terrorists desire to destroy America's nuclear power plants. It is highly relevant to our national security strategy for maximum defense of our nuclear industry.

3. Should America be forced to defend itself in another war with more substantial deployments, nuclear power is certainly a strategic asset to our national defense industry. Current forms of energy would be scarce, and having stable and secure nuclear power must be a part of our national security strategy.

We are fortunate to have coal, natural gas, wind, and sun, but in times of war, keeping the factories of America going for the arsenal of democracy needs all available options. It would take years or months to re-establish a nuclear power facility, time that in times of armed attack, the U.S.A. simply does not have. Nuclear is a key to our national defense industry and essential to the 202 (C) process that I am advocating for.

There are very valid civilian reasons to continue the use of nuclear power, including the research that benefits our national defense, but your task is to declare First Energy's nuclear plants as national defense resources, which they are.

My claims are backed by factual evidence according to national security experts, and known terrorist attacks and thwarted attacks.

I ask you to use the authority at your discretion to declare First Energy's nuclear power plants as national security strategic assets and invoke section 202 (C) as soon as is possible.

Respectfully submitted,

May 2, 2018

VIA ELECTRONIC MAIL AND U.S. MAIL

The Honorable James Richard Perry
Secretary of Energy
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Secretary Perry:

Calpine Corporation ("Calpine") is writing to express grave concerns regarding your consideration of action to economically prop up, through subsidies or otherwise, coal and nuclear plants in the PJM Interconnection, L.L.C. ("PJM") region through the use of emergency powers under Section 202(c) of the Federal Power Act (the "FPA"),¹ or any other statute, including the Defense Production Act (the "DPA")² or the Fixing America's Surface Transportation Act (the "FAST Act").³ We understand that you are considering this action as evidenced by the establishment of the DOE portal for the receipt of materials related to FPA Section 202(c), and as a result of the March 29, 2018 application by FirstEnergy Solutions Corp. and its subsidiaries (together, "FES") seeking an emergency order under Section 202(c).

The competitive power markets have delivered billions of dollars in new, private investment, leading to lower prices to consumers for almost two decades. The foundation on which this success has been built is America's belief in open markets. Participants in these markets need to compete on a level playing field. The proposed actions would tilt the table and not only undermine, but potentially destroy, new private competitive investment, and perhaps more importantly, substantially add to the cost of power to consumers in the region. It also will harm the natural gas industry by reducing demand for this beneficial and abundant fuel source. Mr. Secretary, there is no crisis or national threat that justifies such action.

¹ 16 U.S.C. § 824a(c).

² 50 U.S.C. § 4501, *et seq.*

³ Pub. L. No. 114-94.

Introduction

Calpine is an independent power producer that has approximately 27,000 megawatts of generation in operation or under construction in 18 states and Canada. Backed by a fleet of advanced-technology power plants, Calpine's retail operations also provide access to clean, flexible and reliable resources in competitive markets throughout the United States. As both a producer and a provider of electricity operating in 25 states, Calpine has strongly supported efforts by Congress, the Federal Energy Regulatory Commission ("FERC"), and regional transmission organizations ("RTOs") and independent system operators ("ISOs") to implement competitive wholesale markets. By encouraging entrepreneurialism, these markets have lowered costs for consumers, while avoiding the inefficiencies that historically resulted from central planning and having the government pick winners and losers.

The Requested Action Would Harm Competitive Markets

On March 29, 2018, FES filed an application with you requesting an emergency order under Section 202(c) of the FPA requiring PJM to provide massive subsidies to nuclear and coal-fired generation facilities, including those owned by FES (the "FES Request").⁴

Calpine is seriously concerned about the unprecedented harm that FES's request would have on PJM's competitive power market. PJM's market relies on competition between suppliers to lower costs and promote efficiency, while encouraging the retirement of less efficient generation facilities. But FES now asks the Secretary to undercut this competitive framework by ordering PJM to pay "cost-based rates that provide for full cost recovery" to certain nuclear and coal-fired generation facilities in PJM that have proven to be uneconomic.⁵ These requested subsidies would render a substantial portion of the generation in PJM completely immune to market signals, which is anathema to market principles. As a result:

- Older, inefficient facilities would remain in the market; and
- Subsidized facilities can be expected to offer their energy and capacity at prices that are at or close to zero because they are "guaranteed" payment, thereby depressing market prices.
 - PJM recently explained that only a small amount of subsidized generation will have significant impacts on clearing prices. For example, adding 6,000 megawatts of subsidized generation submitting zero-priced offers in the

⁴ Calpine understands that the Secretary has not yet established notice and comment procedures with respect to the FES Request. See Department of Energy, Office of Electricity Delivery & Energy Reliability, DOE's Use of Federal Power Act Emergency Authority, <https://www.energy.gov/oe/services/electricity-policy-coordination-and-implementation/other-regulatory-efforts/does-use>. Accordingly, Calpine is not addressing each of the numerous flaws in the FES Request at this time, and is instead submitting this letter to highlight at a high level the irrevocable and severe harm that would result if FES's request is granted.

⁵ FES Request at 31.

“Outside MAAC” portion of PJM would represent only four percent of the supply in that area, but would be expected to decrease clearing prices for capacity by as much as 21 percent.⁶

- At the same time, adding only 2,000 MW of subsidized, zero-priced generation in the EMAAC Locational Deliverability Area of PJM would reduce clearing prices by a full third.⁷
- Given that coal-fired generating facilities make up 33 percent of the generation in PJM, and nuclear generating facilities make up another 18 percent of PJM’s generation,⁸ the impact of the requested subsidies on PJM’s clearing prices will be devastating.

It merits emphasis that, by impacting market prices, the requested subsidies for nuclear and coal facilities will engender the need for additional subsidies to support other classes of resources. Lowered clearing prices will result in non-subsidized generators being squeezed out of the market, even if they are more efficient than the subsidized nuclear and coal facilities. In particular, gas generators that are wholly dependent on market revenues will either not clear in PJM’s energy and capacity markets or, even if they do clear, will not receive sufficient revenues to cover their operating costs. Loss of gas generation will, in turn, harm consumers – not only is generation fueled by natural gas highly efficient, but it also provides quick-ramping capability that is necessary to maintain grid reliability in the face of increased usage of renewable resources that have highly variable generation output.⁹ Accordingly, gas generators that are not able to survive on the depressed market prices can be expected to request that the Secretary provide them with similar subsidies under Section 202(c) of the FPA or otherwise. Depressed market prices will also discourage the development of new generating facilities to meet demand, and likely mean that new facilities will only be developed with guaranteed cost support. In short, the FES Request would, if granted, strangle the vibrant competitive markets that have provided benefits for consumers, and necessitate a return to the inefficiencies of traditional cost-based ratemaking.

⁶ Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, Attachment E, Affidavit of Adam Keech on behalf of PJM Interconnection, L.L.C., ¶ 7, FERC Docket No. ER18-1314-000 (filed Apr. 9, 2018).

⁷ *Id.*, ¶ 8.

⁸ See PJM Interconnection, L.L.C., *PJM’s Evolving Resource Mix and System Reliability* (Mar. 30, 2017), at 9, <http://www.pjm.com/~media/library/reports-notice/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx>.

⁹ See, e.g., U.S. Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability* (Aug. 2017), at 11 (“DOE Report”), https://www.energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf; The Brattle Group, *Diversity of Reliability Attributes, A Key Component of the Modern Grid* (May 17, 2017), at 3, https://sites.hks.harvard.edu/hepg/Papers/2017/Brattle_20170517-API-Diversity-of-Attributes.pdf.

FES also has failed to substantiate its claims that an “emergency condition” exists in PJM.¹⁰ As FERC has already determined, after reviewing thousands of pages of comments and evidence submitted by various parties (including FES), there is no basis for FES’s claims that past or planned retirements of nuclear and coal facilities have resulted in a threat to reliability or resilience in PJM or elsewhere.¹¹ PJM has also confirmed that there is no immediate threat to system reliability,¹² and that PJM did not have to rely on coal-fired generating units to avoid blackouts during a prolonged cold snap from December 27, 2017 to January 7, 2018, but voluntarily chose to do so because the cost of coal was lower than the cost of natural gas during that time.¹³ In fact, evidence demonstrates that the nuclear and coal retirements identified in the FES Request are expected and warranted given the age and relative inefficiency of such facilities.¹⁴

In light of the lack of an immediate threat in PJM, Calpine strongly urges the Secretary to reject FES’s request and permit FERC, working with PJM and other RTOs and ISOs, as well as the North American Electric Reliability Corporation, to continue their efforts to address any potential reliability and resilience issues.¹⁵

Alternative Approach

If, notwithstanding this and other submissions, you continue to have resilience or reliability concerns, we urge you to take a transparent and deliberate approach rather than rushing to judgment at high risk of making a decision that could haunt markets and, consequently, consumers and the industry, for many years to come. As explained above, notwithstanding the efforts of FES and coal interests to create a perception of urgency, there is no immediate threat. In particular, PJM has stated that, even those FES units that have announced their retirement will generally remain operational until at least May 2021.¹⁶ And on April 30, 2018, PJM issued a notification definitively concluding that the retirement of FES’s generating units “is not expected to adversely

¹⁰ FES Request at 1.

¹² See Letter from Vincent P. Duane of PJM Interconnection, L.L.C. to the Honorable James Richard Perry re: FirstEnergy Solutions’ Request for Emergency Relief under Section 202 of the Federal Power Act (Mar. 30, 2018), <http://www.pjm.com/-/media/documents/other-fed-state/20180330-response-to-fe-solutions-request-for-emergency-relief.ashx> (“PJM March 30 Letter”).

¹³ See PJM Interconnection, L.L.C., *Perspective and Response of PJM Interconnection to National Energy Technology Laboratories Report Issued March 13, 2018*, <http://www.pjm.com/-/media/library/reports-notices/weather-related/20180413-pjm-response-to-netl-report.ashx?la=en>.

¹⁴ See, e.g., DOE Report at 7, 23 (indicating that coal facilities that recently retired had an average age of 54 years, while the expected life of such facilities is 40 years); *id.* at 25, 32 (many of the nuclear facilities that have retired are single-unit plants that have high costs).

¹⁵ See generally *Grid Reliability*, 162 FERC ¶ 61,012 (initiating proceedings).

¹⁶ See PJM March 30 Letter.

affect the reliability of the PJM Transmission System due to a combination of remedial measures.
...”¹⁷

There is more than adequate time for further study and deliberation on this issue. Indeed, as a result of your prior notice of proposed rulemaking, FERC has already directed PJM, as well as the other RTOs and ISOs, to identify and address any resilience concerns. Moreover, PJM also announced on April 30, 2018, that it is commencing an effort “to analyze fuel security vulnerabilities and establish criteria to assess areas in the PJM system that could face future fuel security issues,” and to implement market solutions to allow eligible resources to compete to meet those criteria.¹⁸ Consequently, there is no urgency, and a rush to judgment will undermine PJM’s current work, thereby doing great harm without advancing the cause of national security beyond what the markets already provide.

In the event that you nevertheless believe some action is warranted at this time, any relief should be tailored to minimize adverse impacts on the competitive markets. In particular, to the extent that you decide it is necessary to grant FES’s request for cost-based compensation, such compensation should be on an interim basis only and should further be contingent on the subsidized facilities operating on a standby basis, and not participating in the PJM energy or capacity markets unless and until FERC declares that there is an emergency. These limitations will not correct the inefficiencies resulting from the requested subsidies, but will at least help protect the viability of PJM’s competitive markets.

¹⁷ Letter from Steven R. Pincus of PJM Interconnection, L.L.C. to the Honorable James Richard Perry re: FirstEnergy Solutions’ Request for Emergency Relief under Section 202 of the Federal Power Act (Apr. 30, 2018), at 4, <http://www.pjm.com/-/media/documents/other-fed-state/20180430-motion-to-intervene.ashx>.

¹⁸ See PJM Interconnection, L.L.C., *PJM Announces Next Phase of Grid Resilience Initiative – Grid operator to examine fuel security risks* (Apr. 30, 2018), http://www.pjm.com/-/media/about-pjm/newsroom/2018-releases/20180430-news-release-fuel-security-initiative_.ashx.

Conclusion

We are convinced that there is no authority or basis under Section 202(c) of the FPA, the DPA, or FAST Act that justifies action to subsidize or otherwise assist uneconomic power plants. There is no industry or national security emergency. PJM has made clear there is no reliability concern that needs to be addressed now. There is no evidence that the supply chain for natural gas suffers from systemic vulnerability. PJM is reviewing resiliency and fuel security issues. In short, there simply is no need for DOE to take action at this time. Against this backdrop, the requested action would be antithetical to the principles of free markets, for no legitimate reason. It would harm consumers, generators (other than coal or nuclear generators), and the natural gas industry. We therefore urge you to reject or ignore FES's self-motivated plea for you to grant its application, and not to take any other action that would have government picking winners and losers.

Respectfully submitted,

Document 138

Dear Secretary Perry:

The International Brotherhood of Electrical Workers (IBEW), Fourth District, represents roughly 50,000 workers employed in a variety of industries across Ohio, Kentucky, West Virginia, Virginia, Maryland, and the District of Columbia. I am writing to encourage you to issue a Section 202(c) emergency order as requested by FirstEnergy Solutions Corporation (FirstEnergy) in its March 29, 2018 application.

The IBEW Fourth District supports all generation sources and believes that grid reliability can be achieved by acknowledging and supporting the unique traits of each generation source. The IBEW supported the Department of Energy's (DOE) study of grid reliability and resiliency and was pleased with the DOE's findings. In the aftermath of that study, I wrote in support of the DOE's Grid Resiliency Pricing Rule. As detailed in FirstEnergy's application for a Section 202(c) emergency order, the Federal Energy Regulatory Commission (FERC) has indicated somewhere between 22,000 and 30,000 megawatts of capacity in PJM alone are at risk of closure. This is in addition to recent and announced baseload retirements. Notwithstanding, FERC rejected the Grid Resiliency Pricing Rule. FERC's rejection of the proposed rule combined with the loss of baseload power make it necessary for you to exercise your Section 202(c) authority in a timely manner.

In the IBEW's Fourth District there are thousands of members and consumers who will be impacted by your decision on FirstEnergy's application. I respectfully urge you to grant its request and ensure that the market and grid are prepared for increased energy consumption over the coming months.

Sincerely,

BRIAN G. MALLOY
INTERNATIONAL VICE PRESIDENT
I.B.E.W. FOURTH DISTRICT

May 22, 2017

Mr. Rick Perry
United State Secretary of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Secretary Perry:

The International Brotherhood of Electrical Workers, Fourth District, represents roughly 50,000 workers employed in a variety of industries across Ohio, Kentucky, West Virginia, Virginia, Maryland, and the District of Columbia. From utilities to rail, many IBEW represented industries have direct experience with baseload power and the electric grid. Safety, efficiency, reliability of generation and the grid are of utmost importance to the IBEW. I appreciate your April memorandum calling for a study that will examine issues regarding the long-term reliability and resiliency of the grid.

I want to take this opportunity to stress the importance of International President Stephenson's comments in his May 16, 2017 letter to you. The IBEW Fourth District supports all generation sources and believes grid reliability and resiliency can be achieved by acknowledging and supporting the unique traits of each generation source. As President Stephenson stated, it is critical to recognize the importance of plants that can operate efficiently 24 hours a day and have on-site fuel supplies.

Grid reliability and resiliency also depend on a skilled workforce that is ready to operate and maintain baseload power plants. In the Fourth District alone, there are thousands of members who are either directly or indirectly regularly employed, ensuring these plants are operating safely and efficiently. These are good jobs that allow IBEW members to support their local economies.

With energy consumption projected to increase steadily over the next two decades, it is important that the market and grid are prepared. I look forward to working with you and providing additional district-specific information as needed.

Sincerely,

Brian G. Malloy
International Vice President
IBEW Fourth District

Re: Proposed Grid Resiliency Pricing Rule, RM 18-1-000

Dear Secretary Bose:

The International Brotherhood of Electrical Workers (IBEW), Fourth District, represents roughly 50,000 workers employed in a variety of industries across Ohio, Kentucky, West Virginia, Virginia, Maryland, and the District of Columbia. Many IBEW-represented industries have direct experience with baseload power generation and the electric grid. On behalf of the workers in the Fourth District, I write in support of the Department of Energy's (DOE) "Grid Resiliency Pricing Rule."

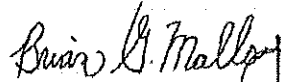

In May of this year, I wrote to the DOE in support of their study of reliability and resilience of the electric grid. In late August, the findings of that study were published, echoing many of the concerns the IBEW has been voicing for years. As discussed in the attached letter from IBEW International President Stephenson, baseload coal and nuclear power plants can operate efficiently 24 hours a day and are unique in that they have on-site fuel sources. These plants are described by the DOE in the proposed rule as "fuel secure" and because of this attribute, coal and nuclear fueled generation are essential for long-term grid reliability and resiliency.

While the IBEW supports all generation sources, the Grid Resiliency Pricing Rule is necessary to ensure coal and nuclear generation are adequately compensated. Despite the aggressive timeline, the proposed changes can be accomplished without disruption of the current market structure. I respectfully

urge the Federal Energy Regulatory Commission to adopt this proposed rule to ensure a balanced, diverse energy mix that can meet future consumer demand.

I look forward to working with you and providing district-specific information as needed.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Brian G. Malloy". The signature is fluid and cursive, with a large loop at the end.

Brian G. Malloy

KENNETH W. COOPER
International
Secretary-Treasurer

May 16, 2017

Mr. Rick Perry
United States Secretary of Energy
1000 Independence Ave., S.W.
Washington, DC 20585

Dear Secretary Perry:

On behalf of the 750,000 active members and retirees of the International Brotherhood of Electrical Workers (IBEW), I write in support of your directive to "initiate a study to explore critical issues central to protecting the long-term reliability of the electric grid" The IBEW represents individuals employed in a variety of fields related to the grid including utilities, construction, manufacturing, and rail. Our practical knowledge of the reliability of the grid makes the IBEW uniquely suited to comment and provide input on the importance of baseload power plants.

In January, the U.S. Energy Information Administration issued its Annual Energy Outlook for 2017.¹ Energy consumption is set to increase 5-11% between 2016 and 2040.² This projection underscores the necessity of our nation's coal and nuclear baseload power plants. Unfortunately, in many areas baseload plants are closing, sometimes prematurely, because of economic challenges. These challenges are partially because of numerous Environmental Protection Agency regulations that the IBEW has provided comment on in addition to subsidies and low natural gas prices.

Baseload power plants need to be appropriately compensated for the megawatts of power they generate. Unlike other generation sources, baseload coal and nuclear power plants can operate efficiently 24 hours a day and provide frequency support services essential to reliability. In addition, on-site fuel supplies make these plants the most reliable because of their ability to withstand severe weather, infrastructure issues, or other catastrophic, unexpected national security events.

For your consideration as a part of the study, I would like to submit the attached documents. In addition, I welcome the opportunity for IBEW experts to meet with your Department of Energy experts working on this important study and implementation plan to discuss our position in greater detail.

Sincerely yours,

Lonnie R. Stephenson
International President

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

**Grid Reliability and
Resiliency Pricing**

)
)
)
)

Docket No. RM18-1-000

**COMMENTS OF THE INTERNATIONAL BROTHERHOOD OF ELECTRICAL
WORKERS, LOCAL UNION 50 IN SUPPORT OF THE PROPOSED RESILIENCY
RULE**

In accordance with the Federal Energy Regulatory Commission's ("FERC" or the "Commission") October 2, 2017 notice and the Commission Staff's October 4, 2017 notice, Local 50 of the International Brotherhood of Electrical Workers (Local 50) respectfully provides our initial comments on the Secretary of Energy's ("Secretary") September 28, 2017 proposed rulemaking (the "Proposed Rule").

On September 28, 2017, the Department of Energy ("DOE") issued the "Grid Resiliency Pricing Rule" (the "Proposal") directing the Federal Energy Regulatory Commission ("FERC") to adopt a rule requiring operators of organized markets to "ensure that certain reliability and resiliency attributes of electric generation sources are fully valued." Such a rule, as contemplated by the regulatory language of the Proposal, will ensure that existing nuclear and coal-fired electric generating stations will be compensated appropriately and fully for their costs of operation and will avoid premature retirement. Adoption of that rule will thus sustain the long-term viability of critical power plants, preserve and create jobs, maintain electric reliability, and provide substantial economic benefits to the many hard-working Americans living throughout the nation.

We have grown increasingly concerned in recent years that well-intended public policy initiatives at both the federal and state level have lost sight of the first principle of the electric utility business: maintaining reliability at all times. This vital work of providing reliability at all times has provided well-paying, honorable work for our members for many

decades. That is why we have been distressed to see the retirement of well running electric generation facilities, primarily coal, in regulated states and nationwide. We are also mindful of the ongoing threats facing the nuclear industry in nominally deregulated states (we refer to such states as nominally deregulated in view of the numerous public policy interventions to favor particular resources). The result of premature retirement of power plants has been loss of opportunity for hard working men and women in addition to reliability threats.

IBEW Local 50 strongly supports the Proposal and shares the Secretary's urgency that FERC act promptly to direct operators of organized markets to issue the requested rule. FERC has the ability to act, and must act, without undue delay to avoid premature closure of crucial power plants and our members' loss of critical economic and reliability benefits. FERC has thoroughly examined how electric markets function and how those markets affect the continued operation of crucial power plants needed for reliability for some time. FERC has the requisite basis to act now.

We were pleased that the Secretary's proposed rule has started an important conversation around pricing for resilience and reliability. We believe that inherent in such discussion is a greater focus on maintaining the fuel diversity that has benefitted our members, the nation's economy, and national security. We note that while this issue was often discussed, it was nowhere near the top of the energy policy agenda until the Secretary's proposed rule was issued. We are grateful to the Secretary for highlighting the importance of this issue and for moving it to the top of the agenda.

I. COMMUNICATIONS

All communications, correspondence, and documents related to this proceeding should be directed to the following person:

Brad Stevens
President & Business Mgr.
IBEW Local 50

brad.stevens@ibew50.org

II. DESCRIPTION OF IBEW LOCAL 50

IBEW Local 50 is a progressive labor organization that represents more than 3,000 individuals employed by Dominion Energy, Southern Company, First Energy, and Craig-Botetourt Electric Cooperative. These men and women keep our electrical grid operating 24 hours a day, seven days a week. Our members work in electric generation facilities of all types, as well as in transmission and distribution of electricity to some of our nation's most essential facilities, including the world's largest naval base, the Pentagon, and numerous other military, intelligence, and homeland security installations. Accordingly, we are mindful of the need to deliver around-the-clock electricity 365 days a year to keep our nation safe and secure, our economy functioning, and our homes heated, cooled, and lit.

III. DESCRIPTION OF IBEW LOCAL 50'S INTEREST IN PROCEEDING

IBEW Local 50 is party to collective bargaining agreements with owners whose portfolios include baseload coal and nuclear power plants located in Alabama, Georgia, North Carolina, Ohio, Pennsylvania, Virginia, and West Virginia. As a result, the wages, terms and conditions of employment of its members may be directly as well as indirectly affected by the actions taken by the FERC and operators of organized markets in this proceeding. Thus, IBEW Local 50 members have a direct and substantial interest in this proceeding. As well, the unique perspective of IBEW Local 50 and its members will only serve to enhance the record in this proceeding.

IV. COMMENTS

The communities where struggling baseload coal and nuclear power plants are located are dependent on the jobs and economic development opportunities the power plants provide. The reductions in operations and capital improvement expenditures at numerous power production and manufacturing facilities across the country has led to extreme hardship for the thousands of union workers employed in this industry as well as their families.

It is imperative that baseload coal and nuclear plants continue to operate in light of these dire circumstances. Baseload coal and nuclear plants provide good paying union jobs and economic opportunities to IBEW Local union members. In addition to direct labor in the generation sector, the maintenance and capital improvement work at the plants supports the local economies by creating thousands of good paying union jobs for contractors. These plants also contribute significant and vital state and local tax revenues that support local schools, police and fire departments and other vital public services. The loss of jobs, tax revenue, and the ripple effect of such losses throughout local economies, will have a severely detrimental impact on the country.

The issuance of a rule preserving the continued operation of resilient baseload coal and nuclear power plants will maintain a reliable supply of electricity for the region's energy-intensive economy in two ways. First, the preservation of certain plants will avoid the need to replace lost generation with imports and the associated construction of infrastructure to facilitate such importation. Preserving baseload coal and nuclear power plants will keep these needed, reliable facilities running close to home without the need to depend on distant resources, particularly during catastrophic events like severe storms, to fulfill our dynamic need for reliable electricity.

Second, premature plant closures will deplete the pool of highly skilled (and specifically trained and experienced) employees. With a depletion of this skilled and experienced group of workers, and the possible replacement of these workers with more distant and perhaps less-skilled individuals, we will see a direct and adverse impact on our ability to maintain the generation facilities that continue to operate and our ability to respond promptly to severe contingencies affecting the operation of these remaining plants in operation. In short, allowing baseload coal and nuclear power plants to close prematurely will have an adverse impact on the reliability of the nation's electricity supply and on the reliable operation of regional electricity systems.

Rates for the sale of electricity that are inadequate to sustain the operation of base load generation facilities that provide reliability and resiliency support cannot be considered to be just and reasonable. Because of the loss of jobs, the significant reduction in payments

to local governments, and the decline in electricity resource and grid reliability that would result from deactivation of nuclear and coal-fired generating facilities it is essential that FERC adopt a rule, such as that proposed by DOE, which will ensure that such generating facilities are fully compensated for their costs and will remain in operation.

In order to mitigate the risk that such generating units may be deactivated prematurely, IBEW Local 50 strongly urges FERC to adopt the rule proposed by the DOE as promptly and comprehensively as possible. We believe that FERC has a sufficient record to act that will be further bolstered by the comments considered in this proceeding. FERC has thoroughly considered the impact of electric markets on the sustained operation of at-risk power plants and, as noted by the Secretary of the DOE, the time to act is now given the severe impacts to system reliability and resilience, and national security, attendant to the premature closure of crucial power plants. Any protracted delay in creating fully compensatory market rules will only exacerbate the problem of pre-mature closures.

In acting promptly, we believe FERC should also direct the organized market operators to issue a rule that is not only compensatory (and based on the regulatory language of the Proposal) but comprehensive and enduring. The rules to be issued by operators of organized markets should be fair and transparent, and should ensure that critical power plants can continue to operate for the long-term and without the prospect of repeated re-examination and adjustment to their market compensation. The uncertainty that less than comprehensive and enduring market rules will engender will defeat the very purpose of preserving the extended operation of these much-needed power plants.

We were pleased that the Secretary's proposed rule has started an important conversation around pricing for resilience and reliability. We believe that inherent in such discussion is a greater focus on maintaining the fuel diversity that has benefitted our members, the nation's economy, and national security. We note that while this issue was often discussed, it was nowhere near the top of the energy policy agenda until the Secretary's proposed rule was issued. We are grateful to the Secretary for highlighting the importance of this issue and for moving it to the top of the agenda.

We urge the Commission to act with the utmost dispatch to work with the Secretary and other policy makers to preserve the around-the-clock resources that power our nation and employ our members. We view the Secretary's action and the Commission's deliberations as bolstering rather than competing with state specific action (such as Virginia's recent decision to encourage life extensions of existing nuclear units). On behalf of our members we stress the need for prompt action, we emphasize the importance of this issue for the day-to-day functioning of our 21st century society, and we encourage the Commission to keep its focus on the big picture needed to address this issue rather than on the vested interests of any particular stakeholder who may argue for delay or inaction.

There is a price to doing nothing. That price is less security for our nation, less prosperity for our economy, and fewer opportunities to the men and women who keep our society running each and every day. For these reasons we urge prompt action.

Thank you for considering our comments.

Respectfully submitted,

A handwritten signature in black ink, appearing to read "B Stevens", with a stylized flourish at the end.

Mr. Francis Brooke
Special Assistant to the President, Domestic Energy and Environmental Policy
The White House
1600 Pennsylvania Avenue NW
Washington, DC 20500

RE: FirstEnergy Solution's Request for Emergency Order

Dear Mr. Brooke:

I am the duly-appointed Public Advocate for the state of Delaware. The Delaware legislature has tasked me with representing the interests of Delaware's ratepayers in federal and state proceedings involving rates and energy policy.

On March 29, 2018, FirstEnergy Solutions Corp ("FES") submitted a Request for Emergency Order Pursuant to Federal Power Act Section 202(c) ("Request" or "Emergency Order Request") to the Secretary of the Department of Energy ("DOE"). I do not believe that FES has presented circumstances that constitute an emergency under Section 202(c) of the Federal Power Act. Further, FES' request attempts to circumvent the legitimate deliberative processes already underway at PJM for its own narrow ends, without any evidence of a legitimate crisis in the capacity market or grid reliability. Therefore, on behalf of the Delaware ratepayers whom I represent, the Delaware Division of the Public Advocate ("DPA") opposes FES' request.

FES' request is overly broad and fails to demonstrate that an emergency exists within the PJM footprint if its coal and nuclear plants are not bailed out. During the December 28, 2017 to January 7, 2018 weather event, the so-called "bomb cyclone," "PJM experienced one of our top 10 winter peak demand days of all time . . . Overall, the grid and the generation fleet performed well. Even during peak demand, PJM had excess reserves and capacity."¹

In addition, "PJM has seen significant new entry (nearly 40,000 MW) of a diverse mix of fuel types since the inception of the capacity market. PJM has experienced over 20,000 MW of coal retirements in the same period, and the average age of the coal units that have retired was over 50 years. In short, the markets have helped to incent new efficient generation of all fuel types and helped to retain existing generation needed to serve electric needs of customers in the PJM footprint."²

¹ PJM Coal Snap Performance. February 26, 2018. <http://www.pjm.com/-/media/library/reports-notice/weather-related/20180226-january-2018-cold-weather-event-report.ashx>. And, as indicated in the January 23, 2018 testimony of PJM CEO Andrew Ott before the U.S. Senate and Natural Resources Committee.

² PJM Coal Snap Performance. February 26, 2018. <http://www.pjm.com/-/media/library/reports-notice/weather-related/20180226-january-2018-cold-weather-event-report.ashx>.

As with any competitive market, price is a key determinant. In this regard, some coal and nuclear plants have become uneconomic. This is the case with FES, as further evidenced by its bankruptcy filing on March 31, 2018.³

If this request is granted, consumers throughout the PJM region will pay higher prices with little if any demonstrated benefit to grid reliability. Meanwhile, there are two pending dockets before the Federal Energy Regulatory Commission (“FERC”) regarding grid resilience and the capacity market construct.⁴ These ongoing dockets will examine the issues raised by FES in a systematic and deliberate way, allowing all interested parties to voice their opinions.

Additionally, consistent with the PJM Tariff, PJM conducted a thorough analysis of its system to determine whether the announced retirements would present reliability issues.⁵ On April 30, 2018, PJM completed this analysis and informed FirstEnergy, “that the deactivation of these generating units is not expected to adversely affect the reliability . . . with these measures, the PJM Transmission system will remain reliable, and therefore the generating units listed above may plan to deactivate as scheduled.”⁶

Again, “PJM can state without reservation there is no immediate threat to system reliability. Indeed, the FES units that announced their expected retirement earlier this week, by their own disclosures, will remain operational in most cases until through May 2021 . . . But even assuming these units do in fact close as of the dates announced, PJM, FERC, and the Department of Energy will have ample time before then to take measures, which at the extreme might include the kind of relief sought in the instant request.”⁷

Given that PJM has stated the system remains reliable, and absent an emergency need (which has not been demonstrated) to subsidize uneconomic coal and nuclear plants, FES’ request for an emergency order should be denied.

Thank you for your consideration of these comments on behalf of the citizens of Delaware.

Sincerely,

/s/ Andrew Slater

Washington, DC 20585

Re: Request for Emergency Order Pursuant to Federal Power Act Section 202(c)

Dear Secretary Perry:

FirstEnergy Solutions Corp. (“FES”), on behalf of its affiliates named in its March 29, 2018 Section 202(c) application (the “Application”), respectfully responds herein to the April 30, 2018 letter to you from PJM Interconnection, L.L.C. (“PJM”) regarding PJM’s Fuel Security Initiative.

PJM’s views on resilience are best summed up by the classic image of Lucy holding a football for Charlie Brown to kick, only to pull it away at the last moment, resulting in Charlie Brown once again flying through the air and landing flat on his back. Indeed, PJM’s latest procedural gambit confirms what FES has been warning DOE (and FERC) about all along: at a time when resilient generation is closing permanently, PJM continues to refuse to act, like Lucy continuing to pull away the football. PJM now suggests that it will take action sometime next year “*if*” PJM thinks it is necessary. Once again, PJM is asking DOE (and the Nation) to “rely on a narrow process run by an entity that has admitted that it does not have a clear view of what resilience is, how to measure it, or how to ensure it.”¹ PJM’s latest letter demonstrates that what was true then remains true now: PJM is either unwilling or unable to address effectively the emergency facing the Nation’s electric grid. But unlike Charlie Brown, DOE does not need to keep blindly “trusting” Lucy since it *can kick the ball now* and address the resilience crisis by granting FES’ Application.

Faced with a growing consensus that something must be done now to address the resilience crisis, and unlike its prior statements to FERC and others eschewing that any real problem exists, PJM now pivots and *belatedly* “recognizes that fuel security raises questions about electric system resilience which go beyond reliability” and that it must “[i]dentify system vulnerabilities and determine attributes . . . that ensure that peak demands can be met during extreme scenarios.”² This sudden revelation rings hollow as it stands in stark contrast to PJM’s

¹ Letter from FirstEnergy Solutions to Rick Perry, U.S. Sec’y of Energy at 1 (Mar. 30, 2018).

² Letter from Steven R. Pincus, Assoc. Gen. Counsel, PJM Interconnection, L.L.C., and Craig Glazer, Vice President, Fed. Gov’t Policy, PJM Interconnection, L.L.C., to Rick Perry, U.S. Sec’y of Energy at 1-2 (Apr. 30, 2018) (“April 30 Letter”).

recent and consistent refusal to acknowledge the problem let alone to act to address resilience issues.³

For example, just two months ago PJM told FERC that: 1) it needed authority to plan for resilience;⁴ 2) it lacked formal resilience criteria;⁵ 3) its existing markets were not designed with resilience in mind;⁶ 4) it required FERC to verify that it correctly identified system threats;⁷ and 5) it lacked requisite information, including real-time conditions on pipelines that support natural-gas fired power plants.⁸ But now PJM asserts all of a sudden that sometime next year it may be capable of identifying resilience attributes and designing a market mechanism to compensate generators for the resiliency benefits they provide “if” action is warranted.

PJM has made a similar about-face with respect to the need for nuclear and coal-fired generation in the electric grid. Following the cold weather in the Eastern United States last winter, Andy Ott, President and CEO of PJM, conceded that “[PJM] couldn’t survive without gas; [PJM] couldn’t survive without coal; [PJM] couldn’t survive without nuclear. [PJM] need[s] them all in the moment.”⁹ Since then, PJM has concluded that its grid “will remain reliable” despite the retirement of three FirstEnergy nuclear plants,¹⁰ representing a combined capacity of approximately 4,000 MW,¹¹ again ignoring concerns related to *resilience*. Further, Mr. Ott recently claimed that “[w]e do not feel we have a vulnerability today, *but will take a look at the system to see if we could have fuel security issues in the future.*”¹²

³ See, e.g., PJM INTERCONNECTION, PJM’S EVOLVING RESOURCE MIX AND SYSTEM RELIABILITY 5-6 (Mar. 30, 2017) (“‘Heavy’ reliance on one resource type, such as a resource portfolio composed of 86 percent natural gas-fired resources, however, raises questions about electric system resilience, which are beyond the reliability questions this paper sought to address.”), <http://www.pjm.com/~media/library/reports-notice/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx>; *Ott Addresses Resilience Importance at Grid 20/20*, PJM INSIDE LINES (Sept. 19, 2017) (quoting Andrew Ott, President and CEO, PJM Interconnection, L.L.C.) (“[Resilience] activities will happen as a part of the discussion. If we don’t do something, it will be done for us.”), <http://insidelines.pjm.com/ott-addresses-resilience-importance-at-grid-2020/>.

¹⁰ April 30 Letter at 3-4.

¹¹ *Generation Deactivations*, PJM, <http://www.pjm.com/planning/services-requests/gen-deactivations.aspx> (last visited May 4, 2018).

¹² *PJM Will Test U.S. Mid Atlantic/Midwest Power Grid for Resiliency*, REUTERS (Apr. 30, 2018) (emphasis added), <https://www.reuters.com/article/pjm-power-resiliency/pjm-will-test-us-mid-atlantic-midwest-power-grid-for-resiliency-idUSL1N1S70XK>.

PJM's ever-shifting and inconsistent statements and positions underscore that action is needed, but PJM will not be the one to take it, at least in any meaningful time frame. PJM's latest announcement is nothing more than a delaying tactic. As PJM knows full well, the design and implementation of a "market-based approach" would take years even under the best circumstances. The grid and the Country do not have years. And as the failure of its capacity performance regime shows, PJM has a dismal track record of adopting effective "market based" approaches to these sorts of issues.

The Nation's wholesale electric markets have failed to recognize and properly value the benefits provided by nuclear and coal-fired generators for years, and, as a result, these generators face the imminent choice of whether to retire. PJM's consistent contradictions demonstrate that it lacks a firm grasp on the resilience problems facing the grid today, let alone how to address them, "if" it ever does.

The Department of Energy recently stated that FERC "has not taken sufficient action" despite "studying the underlying economic and regulatory causes of this problem for years" and so "urge[s] FERC to take *immediate* action to stop the loss of fuel-secure capacity."¹³ But the Department of Energy need not and indeed should not wait on FERC. Rather, urgent action by the Department of Energy is the only way to preserve nuclear and coal-fired generation while a long-term solution is developed by DOE and FERC.

Respectfully submitted,

/s/ Rick C. Giannantonio

Subject: Legal Analysis/Comments of AEE, API, AWEA, EPSA, INGAA, and NGSA
Date: Monday, May 07, 2018 5:40:34 PM
Attachments: [ATT00001.htm](#)
[Trade Associations Letter and Legal Analysis 5-7-18.pdf](#)

Attached, please find a legal analysis prepared jointly by Advanced Energy Economy (AEE), the American Petroleum Institute (API), the American Wind Energy Association (AWEA), the Electric Power Supply Association (EPSA), the Interstate Natural Gas Association of America (INGAA), and the Natural Gas Supply Association (NGSA) regarding FirstEnergy's application for an emergency order under Section 202(c) of the Federal Power Act.

The legal analysis addresses the unsuitability of Section 202(c), as well as the unsuitability of the emergency provisions of the Defense Production Act (DPA) and Section 215A of the Federal Power Act (added by the FAST Act of 2015), to the economic circumstances claimed by FirstEnergy in its application.

This group of associations, which represents a broad cross-section of the energy industry, respectfully urges Secretary Perry reject FirstEnergy's petition under Section 202(c) of the Federal Power Act, as well as any other related action under the Defense Production Act, Section 215A of the Federal Power Act or any other authority that provides unwarranted "emergency" relief.

Thank you,

Jeff

The Honorable James Richard Perry
Secretary of Energy
United States Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Secretary Perry:

On behalf of Advanced Energy Economy, the American Petroleum Institute, the American Wind Energy Association, the Electric Power Supply Association, the Interstate Natural Gas Association of America, and the Natural Gas Supply Association, we write to oppose any action by the United States Department of Energy (DOE or the Department) that would use any of its emergency authorities as a means to provide economic support to a favored class of power plants. Power plant retirements are a normal, healthy feature of electricity markets. There is no emergency or threat to the national defense on which the Department could lawfully base the exercise of its emergency authorities.

I. Introduction

In October 2017, the Department used its authority under Section 403 of the Department of Energy Organization Act to propose a rule to be implemented by the Federal Energy Regulatory Commission (FERC or the Commission). DOE asserted that wholesale power markets do not adequately price the resiliency attributes of “fuel-secure” power plants. DOE defined fuel-secure power plants as those that maintain 90 days of fuel on site – a requirement that only coal and nuclear plants generally satisfy. DOE proposed that any such plants that are located within organized electric markets and that are not subject to cost-of-service rate regulation by any State or local authority (*i.e.* “merchant” plants) should receive full cost recovery along with a return on equity.

In January 2018, the Commission rejected DOE's proposal unanimously.¹ The Commission emphasized its historic commitment to both reliability and markets, observing that it "has been able to focus on both without compromising its commitment to either."² The Commission rejected the notion that the retirement of certain generators in regional transmission organization and independent system operator (RTO/ISO) markets meant that the prices in those markets were unjust and unreasonable.³ The Commission also concluded that DOE failed to establish that its own proposal was just and reasonable. The Commission observed that DOE's proposal would have extended cost recovery to all eligible units "regardless of need or cost to the system" and that the 90-day criterion would have unduly discriminated against other resources with resilience attributes.⁴

Although the Commission rejected DOE's proposal, terminating the proceeding, it did not ignore the issue DOE raised. FERC instead initiated a new proceeding dedicated to (1) developing a common understanding of resilience, (2) identifying how RTOs/ISOs assess threats to resilience, and (3) examining how RTOs/ISOs mitigate threats to resilience within a market context.⁵ In short, the Commission stayed true to its long-standing commitment to promote both markets and reliability "without compromising its commitment to either."

Though DOE's proposal was not adopted by FERC, there is no question that it was directed at the correct agency. DOE rightly identified FERC as the agency with which to raise concerns about the adequacy of wholesale electricity prices and Sections 205 and 206 of the Federal Power Act as the statutory provisions under which those concerns must be evaluated. In the months following FERC's rejection of the DOE NOPR, however, those urging above-market prices for coal and nuclear plants have moved on to other legal theories in the hopes of achieving the same result by other means.

On March 29, FirstEnergy Solutions and its affiliates (collectively, FirstEnergy) petitioned the Department to use its emergency authority under Section 202(c) of the Federal Power Act to issue an order that would give all merchant coal and nuclear plants in PJM a guaranteed return on equity for four years. On April 18, Senator Manchin wrote to President Trump urging him to invoke the Defense Production Act to support coal and nuclear plants. Senator Manchin followed that letter with a similar request to Secretaries Perry and Mattis on April 25. In the weeks that followed, others have suggested yet another authority, Section 215A of the Federal Power Act, which was enacted as part of the FAST Act of 2015.

These other authorities do not do what their proponents claim. All three rely on a finding that the retirement of certain coal and nuclear plants constitutes either an "emergency" or a threat to the national defense. No such finding can credibly be made. In addition, because these authorities are intended for emergency circumstances and threats to the national defense, they afford narrow

⁵ See FERC Docket No. AD18-7.

relief to address those circumstances. They do not empower the Department to provide the long-term out-of-market price support that the coal and nuclear plant owners seek. That authority lies with the Commission, which reviews rate proposals pursuant to Sections 205 and 206 of the Federal Power Act to ensure that they are just and reasonable and not unduly discriminatory or preferential.

II. The Orderly Retirement of Inefficient Generators Does Not Pose an Emergency

The question of whether additional market reforms should be pursued to mitigate fuel supply risks should not be conflated with the question of whether an emergency exists today. The former question is receiving active attention through the appropriate channels. FERC, as noted above, has initiated a proceeding on how resilience can be promoted within RTO/ISO markets. PJM (along with the other RTOs/ISOs) is part of that proceeding and has initiated a number of processes to consider market structure improvements that address potential future resilience challenges in its markets.⁶ The intention of those processes, we hope, is to develop analytically sound measures of resilience and a technology-neutral market-based approach that mitigates resilience risks at the lowest cost to ratepayers. But, while FERC and the RTOs/ISOs are taking the concepts of resilience and fuel security seriously, none of them accept the idea that the orderly retirement of uneconomic power plants constitutes an emergency.

FirstEnergy's claim that an emergency exists rests entirely on the observation that some coal and nuclear plants —most importantly those owned by FirstEnergy — are losing money and are therefore likely to retire in the coming years. That is not an emergency. The retirements FirstEnergy complains about will unfold over a period of years and will be carefully planned. FirstEnergy's three nuclear plants would not deactivate until 2021, and very few of the merchant generators FirstEnergy lists in Attachment A to its application have indicated any intention to retire in the near-term. If PJM determines that the retirement of any of these units would compromise system reliability, it can offer those units cost of service compensation under a "Reliability Must Run" contract that would keep those plants online until the reliability issue is resolved. In this case, PJM has completed its 30-day analysis of the deactivation notice from FirstEnergy regarding the retirement of three units (in 2020 and 2021) and found "the deactivation of these generating units is not expected to adversely affect the reliability of the PJM Transmission System due to a combination of remedial measuresWith these measures, the PJM Transmission system will remain reliable, and therefore the generating units listed above may plan to deactivate as scheduled."⁷

The retirements FirstEnergy complains of come in the context of an oversupplied capacity market and flat or declining demand. PJM's most recent capacity auction yielded a 23.9% reserve margin, which well exceeds its target of 16.6%. Reserve margins have grown because new and diverse

⁶ See, e.g., PJM, *Valuing Fuel Security* (April 30, 2018); see also, ISO New England, *Operational Fuel-Security Analysis* (Jan. 17, 2018), https://www.iso-ne.com/static-assets/documents/2018/01/20180117_operational_fuel-security_analysis.pdf.

⁷ PJM, Letter re First Energy Solutions, Corp. Request for Emergency Order Pursuant to Federal Power Act Section 202(c) Submitted March 29, 2018, (April 30, 2018), <http://www.pjm.com/-/media/documents/other-fed-state/20180430-motion-to-intervene.ashx>

generation resources have come online faster than older units have retired,⁸ and because peak loads continue to decline.⁹ For these reasons, PJM has emphasized repeatedly that there is no emergency. PJM's spokesperson put it succinctly:

There is no immediate emergency. Diversity of the fuel supply is important, but the PJM system has adequate power supplies and healthy reserves in operation today, and resources are more diverse than they have ever been. Nothing we have seen to date indicates that an emergency would result from the generator retirements.¹⁰

The performance of the PJM electric grid during the 2018 Bomb Cyclone further demonstrates that no emergency exists. During the eleven-day period of extreme cold, the system performed well. PJM has explained that “[e]ven during peak demand, PJM had excess reserves and capacity.”¹¹ Moreover, from the perspective of system resilience, PJM showed improvement as measured against the 2014 Polar Vortex. Total forced outages were 40,200 MW during the 2014 Polar Vortex, but declined to 23,751 MW in the 2018 Bomb Cyclone. While higher temperatures explain some of this difference, PJM has explained that it is also attributable to “increased investment in existing resources, improved performance incentives, enhanced winterization measures and increased gas-electric coordination.”¹²

FirstEnergy attempts to flip the positive experience of the 2018 Bomb Cyclone on its head by pointing to a single, flawed study claiming that the region would have suffered “interconnect-wide blackouts” had certain coal plants been unavailable.¹³ The study based this alarmist claim on the observation that, during the cold weather, coal plants provided more incremental generation than did natural gas or nuclear plants. As PJM and others have noted, however, the study misunderstood why those coal plants were dispatched more frequently. PJM explained that, under its economic dispatch model, “PJM dispatched coal units because *their costs were lower* during certain hours of the cold snap. Natural gas and nuclear units were not unreliable or otherwise unavailable to

⁸ Across capacity auctions spanning the last ten years, PJM has added 50,792 MW of new generation capacity, 9,485 MW of demand resource capacity, and 2,062 MW of energy efficiency capacity, while retiring or derating 39,639 MW of existing generating capacity. serve the increased customer demand, nor would PJM have faced ‘interconnect-wide blackouts’ without the particular generating units dispatched.”¹⁴

III. The Department Must Reject FirstEnergy’s Petition under Section 202(c)

Section 202(c) of the Federal Power Act authorizes the Department to order generators to run during times of war or other emergencies. Section 202(c) describes such emergencies as including “a sudden increase in the demand for electric energy, or a shortage of electric energy or of facilities for the generation or transmission of electric energy.”¹⁵ The Department’s definition of “emergency” in its regulations implementing Section 202(c) likewise captures a number of scenarios, all of which it describes as either “unexpected,” “sudden,” or “unforeseen.” As explained above, the orderly retirement of power plants in PJM will unfold over a period of years and in the context of ample supply of generating capacity. There is no “emergency” that could serve as the basis for using the Department’s authority under Section 202(c).

FirstEnergy’s petition seeks to stretch Section 202(c) far beyond what its text can support. Section 202(c) is a “temporary” authority aimed at emergencies; it does not give the Department authority to set national energy policy or to advantage one type of fuel for electric generation over others. After the First Oil Embargo, the Federal Power Commission declined to use its authority under Section 202(c), despite its potential for reducing oil dependence in the electric power sector. The U.S. Court of Appeals for the D.C. Circuit upheld that decision, stating:

We are fully mindful, of course, that current national policy is to discourage reliance on foreign oil, but we cannot fault the Commission for reading Section 202(c) as devoid of a solution. That section speaks of “temporary” emergencies, epitomized by wartime disturbances, and is aimed at situations in which demand for electricity exceeds supply and not at those in which supply is adequate but a means of fueling its production is in disfavor.¹⁶

FirstEnergy’s true problem is not that there is an emergency on the grid, but that its power plants lose money at current market prices. Consequently, its application is a thinly veiled attempt to use Section 202(c) as a substitute for what it could not achieve at the Commission under Sections 205 and 206. It seeks rate assistance for four years, a period that would exceed any conceivable “emergency” time frame. It would apply its rate assistance proposal to *all* coal and nuclear plants, regardless of whether each one is needed to address the purported emergency. Indeed, the only limitation FirstEnergy would impose on the scope of its requested order relates to the type of

¹⁴ PJM, *Perspective and Response of PJM Interconnection to National Energy Technology Laboratories Report Issued March 13, 2018* (April 13, 2018), <http://www.pjm.com/-/media/library/reports-notices/weather-related/20180413-pjm-response-to-netl-report.ashx?la=en>.

¹⁵ 16 U.S.C. § 824a(c).

¹⁶ *Richmond Power & Light v. FERC*, 574 F.2d 610, 615 (D.C. Cir. 1978)(internal citations omitted).

compensation these generators receive, and not whether each generator is necessary to address the supposed emergency.¹⁷

But Section 202(c) is not intended to solve generators' economic problems. As the Assistant Secretary for the Office of Electricity Delivery and Energy Reliability put it recently, "we would never use a 202[c] to stave [off] an economic issue. It's not designed for that."¹⁸ More specifically, Section 202(c) was not designed as a pretext to supersede the Commission's authority over wholesale rates. Where the parties affected by an order do not agree, Section 202(c) ensures that generators receive "just and reasonable" terms for their actions carrying out the order. But that language cannot fairly be read as an independent source of ratemaking authority apart from Sections 205 and 206, given that Section 202(c) was enacted at a time when the Federal Power Commission had authority over the Federal Power Act as a whole.

The Department acknowledged the Commission's exclusive authority over wholesale rates when it first promulgated regulations implementing Section 202(c). The Department stated that it would leave rate issues to the Commission because "this responsibility is vested in the Federal Energy Regulatory Commission (FERC) and must be addressed in its regulations."¹⁹ The Department's regulations, therefore, encourage the use of existing rate schedules for service under Section 202(c) orders, and state that when parties do not agree, FERC, not the Department, has responsibility for resolving "rate issues . . . for determination by that agency in accordance with its standards and procedures."²⁰ DOE's regulations could not be clearer as to which agency bears responsibility for rates. Nonetheless, FirstEnergy requests that the Department, rather than FERC, "step in and determine the just and reasonable compensation."²¹ Neither the Federal Power Act nor the Department's regulations authorize the Department to do so.

IV. The Defense Production Act Does Not Contain Authority to Provide Above-Market Pricing to Power Plants

The Defense Production Act was enacted in 1950, at the beginning of the Korean War. Its purpose was to ensure the availability of critical materials for the national defense, and it has been used that way for decades. As explained below, the Defense Production Act cannot be used to command favorable pricing for a favored class of power plants. Moreover, to invoke the concept of "national defense" for what is transparently a domestic effort to boost an uneconomic segment of industry would be an unprecedented abuse of the Act. The Defense Production Act has enjoyed bipartisan

¹⁷ See FirstEnergy Request at 31 (excluding from the scope of its request generators that "recover any of their capital or operating costs through rates regulated by a duly authorized state regulatory authority, municipal government, or energy cooperative").

¹⁸ Gavin Bade, UTILITY DIVE, *DOE 'would never use' emergency order for uneconomic plants, Walker says* (Feb. 20, 2018), <https://www.utilitydive.com/news/doe-would-never-use-emergency-order-for-uneconomic-plants-walker-says-1/517455/>.

¹⁹ See Economic Regulatory Administration, Energy, *Emergency Interconnection of Electric Facilities and the Transfer of Electricity to Alleviate an Emergency Shortage of Electric Power*, 46 Fed. Reg. 39,984, 39,985 (Aug. 6, 1981).

²⁰ 10 C.F.R. § 205.376.

²¹ FirstEnergy Request at 32.

support for decades and must maintain that support if it is to be re-authorized next year.²² Using this statute to favor a particular industry that is struggling in the competitive markets would threaten that support and risk the loss of an important tool that could be needed to ensure national security.

Because its purpose lies in the national defense, the authority conferred in the Defense Production Act allows certain types of market interventions that are rare in American law. Even so, as broad as it is, the Defense Production Act is not broad enough to do what the supporters of these uneconomic power plants would like. The Defense Production does not allow the government to set prices. Nor does it allow the government to force market participants to buy products or services they do not wish to buy.

Those urging the Executive branch to use the Defense Production Act to bail out power plants have not identified which provision of the Act they would use. But there are only two possibilities: the prioritization and allocation authorities contained in Sections 101(a) and (c), and the financial assistance provisions contained in Title III. Neither set of provisions can be used to force consumers to pay above-market prices for electricity.

a. The Authority to Prioritize Contract Performance and to Allocate Materials Does not Include the Authority to Force Purchases or to Set Prices

Section 101(a) of the Defense Production Act empowers the President to require priority performance of contracts or orders deemed “necessary or appropriate to promote the national defense” and to allocate materials, services, and facilities in a manner necessary to “promote the national defense.” To apply Section 101(a) to products in the civilian market, the President must also find that the material being prioritized or allocated “(1) . . . is a scarce and critical material essential to the national defense, and (2) that the requirements of the national defense for such material cannot otherwise be met without creating a significant dislocation of the normal distribution of such material in the civilian market to such a degree as to create appreciable hardship.”²³ Section 101(c) of the Act authorizes prioritization and allocation specifically for materials, equipment, and services necessary to “maximize domestic energy supplies” upon a finding that such materials are “scarce, critical, and essential—(i) to maintain or expand exploration, production, refining, transportation; (ii) to conserve energy supplies; or (iii) to construct or maintain energy facilities.”²⁴ With respect to all forms of energy, Sections 101(a) and (c) have been delegated by the President to the Secretary of Energy.²⁵

Sections 101(a) and (c) are commonly used to prioritize the performance of defense contracts over civilian contracts. For example, if a factory has a contract to supply the military with a particular item and if the need for that item becomes urgent, the Department of Defense may invoke Section 101(a) and issue a “rated order” to accelerate performance of its own contract ahead of civilian

²² 50 U.S.C. § 4564(a) (stating that the Defense Production Act “shall terminate on September 30, 2019”).

²³ *Id.* § 4511(b).

²⁴ *Id.* § 4511(c).

²⁵ Exec. Order 13603, 77 Fed. Reg. 16651 (Mar. 22, 2012).

orders at the same factory. The Department of Energy and its predecessor agencies have used the Section 101 authorities sparingly. In 1974 and 1975, the Federal Energy Administration used Section 101(a) to ensure the availability of materials necessary for timely completion of the Trans-Alaska Pipeline,²⁶ a project that had strategic importance to the United States after the First Oil Embargo. And in 2001, during the California Energy Crisis, the Department of Energy used Sections 101(a) and (c) of the Defense Production Act alongside the Natural Gas Policy Act of 1978 to ensure performance of contracts to deliver natural gas to Pacific Gas & Electric, which needed the natural gas both to serve retail customers and for electric power generation.

Providing FirstEnergy with the relief it seeks would first require that the President declare that electricity supplies are scarce. As described above, such a declaration cannot be credibly made. But even assuming it could, two further discrete government actions would be necessary: (1) the government must force PJM (or load-serving entities directly) to buy electricity from the favored class of generators, and (2) the government must force PJM (or the load-serving entities) to make those purchases at above-market rates they have not agreed to. Neither of these actions lies within the authority of the Defense Production Act.²⁷

Section 101 of the Defense Production Act gives the government the extraordinary power to force private actors to *sell* their products to the government (or its contractors) when those private actors are contractually committed to sell to other parties. But nothing in the Act would authorize the far greater intrusion of forcing private actors to make purchases against their will, even if such purchases were somehow shown to “promote the national defense” or to “maximize domestic energy supplies.” Section 101 is directed at materials found to be “scarce.” Nowhere does it contemplate that buyers would need any encouragement, much less compulsion, to buy the materials that have been prioritized or allocated.

Moreover, even were the Defense Production Act turned upside down to authorize the government to force private actors to make purchases against their will, the Act provides no authority to set the price for those purchases. The original Title IV to the Defense Production Act authorized the President to fix prices, but that authority expired in 1953.²⁸ Section 101 authorizes the President to prioritize performance of contracts,²⁹ but not to wield the far greater power of dictating the price or other terms of the contract it has prioritized. Indeed, other provisions in the Act foreclose the possibility that it may be used to set prices: Section 104 states that the authorities in Title I,

²⁶ Trans-Alaska Pipeline Priorities Assistance for Construction, 39 Fed. Reg. 34608 (Sept. 26, 1974).

²⁷ There are numerous ways in which the use of the Defense Production Act for this purpose would stray from the language of the Act and its implementing regulations. We have chosen to highlight two of the most fundamental.

²⁸ Defense Production Act Amendments of 1953, Pub. L. No. 83-95, 67 Stat. 129.

²⁹ Section 101(a) also allows the President to “require acceptance” of contracts and orders. 50 U.S.C. § 4511(a). But that authority must be read in light of the statement that it has been included “for the purpose of assuring . . . priority.” See *Hercules Inc. v. U.S.*, 24 F.3d 188, 203 (Fed. Cir 1994) *aff’d* 516 U.S. 417 (1996). The authority to require sellers of critical materials to accept government contracts for purposes of assuring priority delivery does not confer authority to require buyers to accept contracts for purposes of imposing above-market prices.

including Section 101, may not be used to impose price controls without prior authorization by Congress;³⁰ Section 707 states that the prices, terms, and conditions of sale under a prioritization or allocation order should not differ from those for “generally comparable orders or contracts;”³¹ and Section 106, which designates energy as a “strategic and critical material,” states that no provision of the Act, “by virtue of such designation,” should be read to confer any authority to control the “pricing” of any form of energy, including electricity.³²

The regulations implementing Section 101 of the Defense Production Act also show that the authority to prioritize contract performance does not confer the authority to set prices. Those regulations state that priority assistance may not be provided “when a person is attempting to . . . [s]ecure a price advantage.”³³ They also prohibit persons working under allocation or prioritization orders from “charging higher prices or imposing different terms and conditions than for comparable unrated orders.”³⁴ Finally, we note that after the Department of Energy issued its order to address the 2001 California Energy Crisis, it made clear that any changes to the price of natural gas supply contracts in California would have been authorized by the Natural Gas Policy Act, not by the Defense Production Act.³⁵

b. The Defense Production Act’s Loan and Subsidy Provisions May Not Be Used in these Circumstances

Title III of the Defense Production Act confers authority to make loans and loan guarantees in order to reduce “shortfalls of industrial resources, critical technology items, or materials essential for the national defense.”³⁶ As we explain above, there is no such shortfall. But even if such a finding could be made, loans and loan guarantees would be unavailable for these generators for two reasons. First, loans and loan guarantees under the Defense Production Act must be supported by funds appropriated for that purpose to pay for the government’s credit risk.³⁷ Because Congress has appropriated no funds to support these loans, the Department of Defense cannot issue them. Second, even if funds were appropriated, the loans and loan guarantees would be available only if “the prospective earning power of the loan applicant and the character and value of the security pledged provide a reasonable assurance of repayment of the loan in accordance with the terms of

³⁰ 50 U.S.C. § 4514(a).

³¹ *Id.* § 4557.

³² *Id.* § 4516.

³³ 15 C.F.R. § 700.55; 10 C.F.R. § 217.44.

³⁴ 15 C.F.R. §§ 700.13(a)(2) and 700.35(b); 10 C.F.R. §§ 217.33(a)(2) and 217.55(b).

³⁵ *See The California Energy Crisis and Use of the Defense Production Act: Hearing before the S. Comm. on Banking, Housing, and Urban Affairs, 107th Cong. 27 (2001) (Response to Written Questions of Senator Gramm from Eric J. Fygi: “Q.2a. Was the Natural Gas Policy Act or the Defense Production Act used to set prices under the Order? A.2a. To the extent that it might have proven necessary to ‘set prices’ under the emergency order, the authority to do so would have been the Natural Gas Policy Act.”).*

³⁶ *See* 50 U.S.C. §§ 4531- 32.

³⁷ *See id.* §§ 4531(a)(3)(A) and 4532(c)(1)(A) (incorporating provisions of the Federal Credit Reform Act).

the loan.”³⁸ The central argument of FirstEnergy’s application under Section 202(c), and of the Department’s NOPR to FERC, is that coal-fired and nuclear generators are retiring because they lose money under current market conditions – a fact underscored by FirstEnergy’s bankruptcy filing. Given this record, there could be no basis to conclude that loans to these generators come with a “reasonable assurance of repayment.”

Title III also allows for purchase commitments and subsidy payments to address national defense needs.³⁹ But electricity produced from nuclear and coal-fired power plants would not qualify for this type of support. For one, subsidy payments are available only for “raw or nonprocessed material” (which electricity is not) or to address temporary increases in transportation costs affecting critical materials (which is not the reason why aging power plants in PJM are uneconomic).⁴⁰ But, even if these eligibility criteria were overlooked, any assistance under these provisions would be limited to the lesser of the amount of uncommitted appropriated funds available,⁴¹ or \$50 million, absent an Act of Congress specifically authorizing a greater amount.⁴² Needless to say, \$50 million would be insufficient to pay for the subsidy requested by FirstEnergy. In fact, FirstEnergy Solutions’ recent bankruptcy filing reveals that \$50 million would be insufficient to cover the losses of even *one* of its coal-fired power plants for *six months*.⁴³ Providing this “drop in the bucket” of FirstEnergy’s losses would also drain almost completely the funds Congress has made available for *national defense*, not economic favoritism.

V. Section 215A of the Federal Power Act Authorizes Only Temporary Measures in Response to Grid Security Emergencies

In December 2015, Congress enacted the FAST Act, which added a new section, Section 215A, to the Federal Power Act. Section 215A authorizes the Department of Energy to issue “orders for emergency measures” in response to a “grid security emergency.” A “grid security emergency” is

³⁸ *Id.* §§ 4531(a)(2)(D) and 4532(b)(2)(D).

³⁹ *Id.* § 4533.

⁴⁰ *Id.* § 4533(c)(1)(a).

⁴¹ In the most recent appropriations act, Congress appropriated \$67 million for all Defense Production Act financial assistance activities. Consolidated Appropriations Act, 2018, Pub. L. No. 115-141 at 111.

⁴² 50 U.S.C. § 4533(a)(6)(C). The \$50 million limitation was added in the 2014 reauthorization of the Defense Production Act. *See also* 160 Cong. Rec. H7002-04 (daily ed. Jul. 29, 2014). (Statement of Rep. Campbell: “Title III authorizes the President to use loans, purchase commitments, and grants to encourage contractors to establish or expand industrial capacity and produce items that are essential to the national defense that must be domestically produced but are otherwise not economically attractive enough to have a domestic producer. These programs are usually small, typically less than \$15 million, and in the history of the DPA, going back to the Korean war, only three have exceeded \$50 million, each of which was specifically authorized by Congress.”).

⁴³ Mot. of the Debtors for Entry of an Order Authorizing the Debtors to Reject Certain Lease Agreements at 10, *In re FirstEnergy Solutions Corp., et al.*, No. 18-50757 (Bankr. N. D. Ohio Apr. 1, 2018) (explaining that, even before the recent fire, the Mansfield Plant was expected to have a cash flow shortfall of \$104 million in 2018).

defined as the occurrence or imminent danger of cyberattacks, electromagnetic pulse attacks, geomagnetic storms, and direct physical attacks that would have significant adverse effects on the reliability of critical electric infrastructure.

The retirement of coal and nuclear plants would not, of course, fit within any of these categories. Nevertheless, some have suggested the Administration use Section 215A on the idea that the potential for a successful cyberattack on natural gas operations makes the electric grid vulnerable due to its reliance on natural gas. As we explain below, Section 215A is not available to address cyber-intrusions into the natural gas supply chain and, in any case, would not support long-term cost of service rate recovery for coal and nuclear plants. But, even if the statute were available for this purpose, the potential for a successful cyber-attack on the natural gas supply chain could not credibly form the basis of any emergency finding any more than speculation of potential cyber-attacks on any other supply resource or energy-related operations. The natural gas industry takes cybersecurity seriously, and continues to be proactive in taking the necessary precautions to protect its operations. Moreover, there is no evidence to conclude that an attack would cause widespread loss of operational capability.

The physical operations of natural gas production, transmission, and distribution make the system inherently reliable and resilient. Disruptions to natural gas service are rare. When they do happen, a disruption of the system does not necessarily result in an interruption of scheduled deliveries of natural gas supply because the natural gas system has many ways of offsetting the impact of disruptions. As noted in a report from MIT:

The natural gas network has few single points of failure that can lead to a system-wide propagating failure. There are a large number of wells, storage is relatively widespread, the transmission system can continue to operate at high pressure even with the failure of half of the compressors, and the distribution network can run unattended and without power. This is in contrast to the electricity grid, which has, by comparison, few generating points, requires oversight to balance load and demand on a tight timescale, and has a transmission and distribution network that is vulnerable to single point, cascading failures.⁴⁴

Moreover, Section 215A does not empower the Department to take action in response to cyberattacks directed outside the electric system. Section 215A defines “grid security emergency” to include cyberattacks directed at “electronic devices or communications networks” that are “essential to the reliability of critical electric infrastructure.” Critical electric infrastructure is defined as a subset of the “bulk-power system,” which is itself defined in Section 215 to include electric transmission and generation, but not natural gas supply chain infrastructure.

Finally, the relief FirstEnergy sought in its Section 202(c) application, and that the Department proposed in its NOPR to FERC, far exceeds what is available under Section 215A. Once the requisite finding of a “grid security emergency” is made by the President, Section 215A authorizes

⁴⁴ Massachusetts Institute of Technology, Lincoln Laboratory, *Interdependence of the Electricity Generation System and the Natural Gas System and Implications for Energy Security* (May 2013), <https://www.ll.mit.edu/mission/engineering/Publications/TR-1173.pdf>.

the Department to “issue such orders for emergency measures as are necessary in the judgment of the Secretary to protect or restore the reliability of critical electric infrastructure or of defense critical electric infrastructure during such emergency.” Orders providing for “emergency measures” may last only fifteen days before an additional emergency finding is required. The fifteen-day limitation shows clearly that when Congress used the words “emergency measures” it meant them in the ordinary sense that emergency measures are temporary and short-lived. FirstEnergy’s request that certain favored power plants receive rate recovery for four years, or the Department’s NOPR, which was of indefinite duration, would far exceed an authority limited to providing temporary, emergency relief.

V. Conclusion

For the foregoing reasons, the Department must reject FirstEnergy’s petition under Section 202(c) of the Federal Power Act, as well as any other related action under the Defense Production Act, Section 215A of the Federal Power Act or any other authority that provides unwarranted “emergency” relief.

Sincerely,

Advanced Energy Economy

Secretary Rick Perry
U.S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585
AskOE@hq.doe.gov

Dear Secretary Perry,

Pretty much anyone even tangentially connected to the electric power industry waits with bated breath for DOE's decision on the March 29 request by First Energy Solutions that the Department declare a national emergency under Section 202(c) of the Federal Power Act for *all* nuclear and coal power plants in PJM for a minimum of four years.¹ Such an action would be unprecedented, unjustified under the authorities in the statute, and would cost consumers tens of billions of dollars. That's why Public Citizen joins the diverse protest chorus of other groups that formally oppose First Energy's multi-billion dollar ratepayer bailout request, and, while we're all waiting on this monumental decision, we submit several requests designed to introduce transparency into this process.

All Submissions and Communications On First Energy's Request Must Be Part of Public Record

Given the enormous implications the DOE's decision will have on consumers, energy markets, the future of electricity policy—and the legal work load of dozens of trade associations, public interest groups and various companies, states and a whole slew of other entities too numerous to name—the DOE must treat this proceeding as it would a public docket, providing a comprehensive public record not only of submissions to DOE regarding First Energy's request, but all communications, records and other material reflecting DOE's information gathering with outside parties and other Federal agencies (including the White House) on the First Energy 202(c) request. First Energy's request is so unprecedented, and the consequences of granting such emergency authority so dire, that the public interest can only be satisfied with a complete and open public docket. Right now, the public is denied access to any comprehensive, official record of comments, submissions and other key documentation that the DOE could use to make a decision on First Energy's unprecedented request.

Our survey of publicly-available submissions to DOE on the First Energy request show unanimity in opposition to granting an emergency under 202(c). For example, on April 5 the PJM Industrial Customer Coalition submitted a formal Protest of First Energy's request², as did

¹ <https://statepowerproject.files.wordpress.com/2018/03/fes-202c-application.pdf>

² http://blogs.edf.org/energyexchange/files/2018/04/Protest-of-PJM-Consumer-Representatives_FES-Emergency-Order-Request-A6290222.pdf

215 Pennsylvania Avenue, SE • Washington, D.C. 20003 • 202/546-4996 • www.citizen.org

the American Public Power Association on April 9.³ The American Petroleum Institute (a formidable lobby shop that knows a thing or two about cutting through the flak and going straight to the top decision maker) bypassed DOE entirely in its request to the President of United States to reject First Energy's request.⁴ On April 24, the Advanced Energy Economy submitted comments requesting the Department reject First Energy's request.⁵

Opinions and Communications by and with White House Lawyers As Referenced in the August 4, 2017 Letter from Robert Murray Must Be Made Public As Part of This Proceeding

The inception of First Energy's radical Section 202(c) request appears to originate with Robert Murray, Chairman, President and Chief Executive Officer of Murray Energy Corporation. An infamous memo dated August 4, 2017 signed by Mr. Murray, summarizes a series of meetings and communications the coal magnate had with a variety of Trump Administration officials—including the President of the United States—detailing Murray's efforts a year ago to push the Administration to declare a national emergency for First Energy's failing power plants under 202(c).⁶

It is important to note that *four days* after Mr. Murray authored this letter to the Trump Administration demanding action on declaring an emergency under 202(c), Murray Energy Corporation gave \$1 million to America First Action, Inc., a SuperPAC tied to promoting President Donald Trump and his Administration.⁷ Perhaps the \$1 million helped the President of the United States focus on the letter's contents.

Murray writes in the letter that he “personally” spoke with President Trump at a July 25 rally in Youngstown, Ohio event requesting “that President Trump direct Energy Secretary Rick Perry to invoke Section 202(c) of the Federal Power Act declaring an emergency on the electric power grid.” [at Page 1]. Murray claims President Trump then “turned to Energy Secretary Rick Perry and said three times ‘I want this done’”. [at Page 1]

Murray's letter continues: “It's been 3 weeks since we last talked to you [about declaring an emergency under 202(c)] and there seems to be no resolution and no action . . . Our understanding is that White House lawyers have some concern regarding 202 C . . . While we are trying to reduce the level of concern of White House lawyers—and we think we are having some success, time is a luxury we do not have. We can understand why [White House] lawyers don't want to risk losing . . . Even if we are wrong and this fails, at least we can tell our people

³ www.publicpower.org/periodical/article/association-urges-doe-reject-firstenergy-plea-emergency-order

⁴ www.api.org/~media/Files/News/Letters-Comments/2018/4-13-18-Ltr-to-the-President-Federal-Power-Act-Section-202c.pdf

⁵ www.aee.net/articles/aee-urges-doe-reject-emergency-support-of-coal-nuclear-plants

⁶ www.documentcloud.org/documents/3936141-Murray-s-letters-to-Trump-administration.html

⁷ <http://docquery.fec.gov/cgi-bin/forms/C00637512/1199534/sa/ALL>

215 Pennsylvania Avenue, SE • Washington, D.C. 20003 • 202/546-4996 • www.citizen.org

you did everything possible and that you left no stone unturned . . . We need action. DOE must enact 202 C.” [Murray letter, at Page 3]

It is clear that First Energy’s request began not with its March 29, 2018 demand, but rather with Robert Murray’s formal initiative beginning on July 25, 2017. Therefore, records of all communications and meetings described in Robert Murray’s August 4, 2017 letter—including those describing the legal opinions of White House lawyers as described in the letter—must be made public as part of this proceeding.

Communications Regarding the Design, Development and Dissemination of a NETL Report That Was Publically Released 48 Hours Before First Energy’s Request Must Be Made Public As Part of this Record

The First Energy request prominently features a U.S. Department of Energy National Energy Technology Laboratory (NETL) study⁸ that purports to show that “coal was the most resilient form of power generation” during the 13-day cold snap that hit the East Coast beginning December 27, 2017. Although the NETL report is dated March 13, DOE did not publicly release it until March 27 (“The new report, released today...” reads the Office of Fossil Energy web site dated March 27, 2018).⁹

It seems an incredible coincidence that First Energy’s 202(c) request so prominently features a report that was not released to the public 48 hours before First Energy’s request.

But not really. Less than two months before First Energy’s request, Doug Matheney, special adviser to Energy Secretary Rick Perry, told the West Virginia Mining Symposium in Charleston, West Virginia on January 31, 2018 that he’s “here to help” the coal industry; that his “one purpose” for going to serve as Secretary Perry’s top advisor is to help the U.S. coal industry; that the DOE’s job is to give coal “a positive outlook”; and that DOE must “understand the importance of coal to the generation of electricity and to the reliability and resilience of the grid.”¹⁰ I believe Mr. Matheney—after all, prior to his current senior advisor position to Energy Secretary Perry, he ran the National Mining Association’s Count on Coal Initiative in Ohio.¹¹

⁸ *Reliability and the Oncoming Wave of Retiring Baseload Units, Volume I: The Critical Role of Thermal Units During Extreme Weather Events*, DOE/NETL-2018/1883, www.netl.doe.gov/research/energy-analysis/search-publications/vuedetails?id=2594

⁹ www.energy.gov/fe/articles/netl-study-highlights-importance-coal-power-generation-during-bomb-cyclone-power-demands

¹⁰ Taylor Kuykendall, Energy department adviser assures US coal industry he's 'here to help', *S&P Market Intelligence*, January 31, 2018,

<https://platform.mi.spglobal.com/web/client?auth=inherit#news/article?id=43381678&cdid=A-43381678-12327>

¹¹ Hannah Northey, “Political hires climb aboard,” *E&E News*, March 8, 2017

215 Pennsylvania Avenue, SE • Washington, D.C. 20003 • 202/546-4996 • www.citizen.org

To allay concerns that the DOE is using its Laboratories as advocacy tools for select private interests, all communications and records regarding the design, development and dissemination of the NETL report must be made public as part of this record.

Both First Energy's 202(c) Request And Possible Action Under the 1950 Defense Production Act Must Be Rejected Because No Emergency Exists From The Company's Bankruptcy

The Department's regulations defining an "emergency" for the purposes of 202(c) appear to prohibit its use for the kind of economic issues faced by First Energy's bankruptcy: "Situations where a shortage of electric energy is projected due solely to the failure of parties to agree to terms, conditions or other economic factors relating to service, generally will not be considered as emergencies unless the inability to supply electric service is imminent."¹²

Indeed, PJM's March 30 response to First Energy's request concludes that "PJM can state without reservation there is no immediate threat to system reliability."¹³ And a subsequent May 3 *Generation Deactivation Notification Update* concludes that the retirement of 4,000 MW identified in the First Energy request poses no reliability concern whatsoever.¹⁴ Similar conclusions were reached last year in Public Citizen's congressional testimony¹⁵ and Public Citizen filings in Federal Energy Regulatory Commission Docket No. RM18-1.¹⁶ Indeed, FERC ruled 5-0 in its January 8, 2018 order rejecting the Department of Energy's first attempt to bail out First Energy's uneconomic power plants, concluding that "the extensive comments submitted by the RTOs/ISOs do not point to any past or planned generator retirements that may be a threat to grid resilience."¹⁷

While First Energy has not publicly requested it, rumors are circulating that—given the uphill legal battle that taking action under 202(c) presents—the President will act using the *1950 Defense Production Act*.¹⁸ Bailing out First Energy's power plants (or all nuclear and coal power plants in PJM, as First Energy has requested) utilizing the 1950 DPA is even more dubious than using 202(c). The 1950 DPA authorizes the federal government to inject cash into companies essential for national defense in order to protect domestic supplies of key products.

But the First Energy bankruptcy presents no energy supply emergency, and the eventual retirement of these power plants pose no threat to supplying energy for national defense, and no national security emergency exists as a result of the First Energy bankruptcy. Past uses of the 1950 DPA include the 2000-01 California Deregulation Crisis¹⁹ (power outages caused by one of the largest corporate market manipulation frauds in history), and more recently in 2012 to provide assistance to the biofuels industry to provide needed fuel supplies for military ships and aircraft. Utilizing the 1950 DPA to bail out failing nuclear and coal power plants would cost consumers and/or taxpayers billions of dollars—an amount far higher than Congress typically allocates for the 1950 DPA. Indeed, the Omnibus spending bill passed earlier this year allocated \$67.4 million for the 1950 DPA.²⁰

Finally, government action isn't needed because the power market has long adjusted to such bankruptcies: bondholders of secured debt on such bankrupt facilities often sell such assets for cheap to plenty of interested buyers. For example, the private equity owner of the National Basketball Association's Detroit Pistons just bought himself an 800 MW natural gas power plant in PJM from NRG's bankrupt GenOn subsidiary²¹. Perhaps First Energy's approach has been all wrong: instead of seeking handouts from consumers and taxpayers, instead owners of uneconomic power plants should be stroking the egos of the proprietors of various professional sports teams as prospective purchasers of generation assets. The power plants could have their own mascots, and maybe even additional revenues could be procured through naming rights.

To: AskOE
Subject: Letter to President Trump regarding First Energy Solutions
Date: Tuesday, May 08, 2018 4:39:41 PM
Attachments: FINAL AFEC President Letter.pdf

May 8, 2018
President Donald J. Trump
The White House
1600 Pennsylvania Ave.
Washington, D.C. 20500
Dear Mr. President:

As the Alliance for Energy Choice – a grassroots organization dedicated to keeping energy costs low in Ohio – we urge you to reject the unprecedented request from FirstEnergy Solutions (FES) for an emergency order under Section 202(c) of the Federal Power Act. Recent news reports indicate that your Administration may also be looking into possible use of the Defense Production Act and other federal statutes in light of the FES application.

This request is likely a last and desperate attempt by FES to seek a government-funded bailout as they look to escape the consequences of their fiscal mismanagement and poor decision-making.

FES first sought a bailout from Ohio consumers using bill riders, but so far, this attempt at hijacking rates has been held at bay. FES next sought a bailout through a Grid Resilience Pricing Rule but were again thwarted by pro-market ideals, this time from the Federal Energy Regulatory Commission.

Now FES is turning to you and asking the President of The United States to use a wartime power to shield them from competition by shifting financial risk onto consumers.

If this were to be granted, it would not only represent an historic use of a wartime power in a time of peace, but also run contrary to your administration's mission of growing the American economy through competition, increasing our global competitiveness, and modernizing our infrastructure. Any attempt to alter energy markets in this way would result in a significant step backwards in accomplishing these important public-policy goals and undoubtedly increase energy costs for Americans.

Energy competition has been a boon for consumers and businesses, as they continue to enjoy historically low energy rates, while at the same time seeing an increase in

reliability.^{[1], [2]} This energy boom has also created thousands of new, good-paying jobs, providing a boost to the American economy and increasing this country's energy independence. Abundant, low-cost Utica and Marcellus Shale gas that fuels many of our factories and power plants in the Appalachian region would surely suffer as a result of any action taken to subsidize competing plants and fuel sources.

As you are aware, the powers granted to your office by the Defense Production Act of 1950 are vast. They were first derived in the aftermath of the Second World War to ensure adequate domestic production during times of war. By comparing their shrinking profits and falling stock prices to a national crisis on the scale of war, FES asks your office and the powers granted to you under this law to consider their company-specific, self-inflicted financial woes as a national emergency. It would be both unprecedented and unfathomable to use wartime powers to bailout one single company who has not been able to show that their assets are critical to electric grid reliability or national defense. We trust you will see this FES "Hail Mary" attempt at superseding free market competition as harmful to the plights of individual Americans and counter to American economic principles. Please reject this desperate plea and protect energy competition and the free market in the United States.

Thank you for your consideration of our request and we look forward to working with you and your Administration in continuing to pursue our shared vision of providing American businesses and consumers with affordable, reliable, American-made energy.

Sincerely,

The Alliance for Energy Choice

Cc: Honorable James Richard Perry, Secretary of Energy

The Alliance is a non-profit advocacy organization made up of independent power producers and power plant developers. We promote fairness and competition among electric utilities and advocate for market solutions that will ensure an adequate and fairly-priced supply of electric power to Ohio's residents and businesses. Alliance members include: Calpine, Eastern Generation, NRG, Vistra Energy, and The Energy Professionals of Ohio.

Alliance for Energy Choice

VIA EMAIL

May 8, 2018

President Donald J. Trump
The White House
1600 Pennsylvania Ave.
Washington, D.C. 20500

Dear Mr. President:

As the Alliance for Energy Choice – a grassroots organization dedicated to keeping energy costs low in Ohio – we urge you to reject the unprecedented request from FirstEnergy Solutions (FES) for an emergency order under Section 202(c) of the Federal Power Act. Recent news reports indicate that your Administration may also be looking into possible use of the Defense Production Act and other federal statutes in light of the FES application.

This request is likely a last and desperate attempt by FES to seek a government-funded bailout as they look to escape the consequences of their fiscal mismanagement and poor decision-making.

FES first sought a bailout from Ohio consumers using bill riders, but so far, this attempt at hijacking rates has been held at bay. FES next sought a bailout through a Grid Resilience Pricing Rule but were again thwarted by pro-market ideals, this time from the Federal Energy Regulatory Commission.

Now FES is turning to you and asking the President of The United States to use a wartime power to shield them from competition by shifting financial risk onto consumers.

If this were to be granted, it would not only represent an historic use of a wartime power in a time of peace, but also run contrary to your administration's mission of growing the American economy through competition, increasing our global competitiveness, and modernizing our infrastructure. Any attempt to alter energy markets in this way would result in a significant step backwards in accomplishing these important public-policy goals and undoubtedly increase energy costs for Americans.

Energy competition has been a boon for consumers and businesses, as they continue to enjoy historically low energy rates, while at the same time seeing an increase in reliability.^{1, 2} This energy boom has also created thousands of new, good-paying jobs, providing a boost to the American economy and increasing this country's energy independence. Abundant, low-cost Utica and

<http://www.pjm.com/~media/library/reports-notice/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx>.

² Average Price of Electricity to Ultimate Customers by End-Use Sector, " U.S. Energy Information Administration. February 27, 2018. Accessed March 14, 2018.

https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_5_6_a.

Marcellus Shale gas that fuels many of our factories and power plants in the Appalachian region would surely suffer as a result of any action taken to subsidize competing plants and fuel sources.

As you are aware, the powers granted to your office by the Defense Production Act of 1950 are vast. They were first derived in the aftermath of the Second World War to ensure adequate domestic production during times of war. By comparing their shrinking profits and falling stock prices to a national crisis on the scale of war, FES asks your office and the powers granted to you under this law to consider their company-specific, self-inflicted financial woes as a national emergency. It would be both unprecedented and unfathomable to use wartime powers to bailout one single company who has not been able to show that their assets are critical to electric grid reliability or national defense. We trust you will see this FES "Hail Mary" attempt at superseding free market competition as harmful to the plights of individual Americans and counter to American economic principles. Please reject this desperate plea and protect energy competition and the free market in the United States.

Thank you for your consideration of our request and we look forward to working with you and your Administration in continuing to pursue our shared vision of providing American businesses and consumers with affordable, reliable, American-made energy.

Sincerely,

The Alliance for Energy Choice

Cc: Honorable James Richard Perry, Secretary of Energy

The Alliance is a non-profit advocacy organization made up of independent power producers and power plant developers. We promote fairness and competition among electric utilities and advocate for market solutions that will ensure an adequate and fairly-priced supply of electric power to Ohio's residents and businesses. Alliance members include: Calpine, Eastern Generation, NRG, Vistra Energy, and The Energy Professionals of Ohio.

Re: Objections to FirstEnergy Solutions Corp.'s Request for Emergency Order Pursuant to Federal Power Act Section 202(c)

Dear Secretary Perry:

The Attorneys General of Massachusetts, Connecticut, Illinois, Maryland, North Carolina, Oregon, Rhode Island, Virginia, Washington, and the District of Columbia submit these objections to the request dated March 29, 2018 by FirstEnergy Solutions Corp. and its subsidiaries (collectively "FirstEnergy") to the Secretary of Energy ("Secretary") for an emergency order under section 202(c) of the Federal Power Act, 16 U.S.C. § 824a(c) ("section 202(c)") (the "Request").¹ Specifically, the Request asks you to: i) find an emergency exists in the control area of the PJM Interconnection, L.L.C. ("PJM") due to an alleged "system resiliency" risk, ii) order certain merchant nuclear and coal-fired generators with on-site fuel supply to enter into multi-year contracts with PJM, and iii) order PJM to pay those generators at above-market rates that provide for "full recovery of all costs necessary to ensure continued operations."²

The undersigned Attorneys General have a significant interest in protecting public health and welfare and electric customers from the pollution, increased costs, and other harms associated with subsidizing uneconomic coal-fired and nuclear generators at above-market rates. Abusing section 202(c) in the manner requested by FirstEnergy would set a dangerous precedent that threatens all of our states, including those located outside of PJM's service territory.

The Request is legally flawed, and you should unequivocally deny it. Because

¹ See Letter from Rick C. Giannantonio, General Counsel, FirstEnergy Solutions Corp. et al., to James Richard Perry, Sec'y of Energy, U.S. Dep't of Energy [DOE] (Mar. 29, 2018) [hereinafter Request].

² *Id.* at 1, 31.

FirstEnergy fails to identify any “emergency,” the requested section 202(c) order would be unlawful and *ultra vires*. Furthermore, the requested order would undermine competitive regional power markets, burden customers with excessive costs, undercut state energy laws and policies, and exacerbate pollution and public health harms.

I. FirstEnergy’s Declining Profits and Generalized Market Grievances Do Not Constitute an “Emergency.”

Issuing a section 202(c) order to address the declining economics of certain generators would be a grave abuse of the Federal Power Act. Section 202(c) explicitly authorizes the Secretary to issue temporary orders only in wartime or other “emergency” situations resulting from “sudden” electricity demand spikes or supply shortages.³ The “sudden” “emergenc[ies]” contemplated in section 202(c) do not include inefficient generators’ failure to turn a profit or their orderly displacement by other resources—a natural consequence of competitive markets.

Though the Federal Power Act does not define the terms “emergency” or “sudden,” the plain meaning of these terms indicates that Congress intended section 202(c) authority to be invoked rarely, in response to acute events that demand immediate response. As the D.C. Circuit Court of Appeals has recognized, the text dictates that circumstances triggering a section 202(c) order are specific, unexpected, urgent, and temporary.⁴

The Department of Energy’s (“Department”) interpreting regulations and historical use of section 202(c) authority accord with the text’s plain meaning. The Department defines an “emergency” as, *inter alia*, an “unexpected” supply shortage, which “may be the result of weather conditions, acts of God, or unforeseen occurrences not reasonably within the power of the affected ‘entity’ to prevent.”⁵ The Department’s regulations further state that section 202(c) orders “are envisioned as meeting a *specific* inadequate power supply situation.”⁶ Accordingly, the Department has rarely exercised its section 202(c) authority. Past emergency orders typically have responded to acute crises such as blackouts or severe storms.⁷

The Request fails to show that any specific, unexpected, or urgent supply threat exists in PJM. The Request instead relies primarily on general predictions that some aging U.S. coal-fired and nuclear generators will retire over the next decade. The Request specifically identifies three

³ 16 U.S.C. § 824a(c)(1).

⁴ See *Richmond Power & Light v. FERC*, 574 F.2d 610, 615 (D.C. Cir. 1978) (stating that section 202(c) “speaks of ‘temporary’ emergencies, epitomized by wartime disturbances, and is aimed at situations in which demand for electricity exceeds supply”). See also *Fed. Power Comm’n v. Fla. Power & Light Co.*, 404 U.S. 453 n.1 (1972) (relating section 202(c) to “the exigencies of ‘war’”); *Duke Power Co. v. Fed. Power Comm’n*, 401 F.2d 930, 944 (D.C. Cir. 1968) (stating that section 202(c) “relate[s] exclusively to temporary interconnections during national emergencies”).

⁵ 10 C.F.R. § 205.371 (other examples may include a “sudden” demand spike, a fuel shortage, “regulatory action” prohibiting the use of certain generators, or “[e]xtended periods of insufficient . . . supply” due to planning failures).

⁶ *Id.* (emphasis added).

⁷ See, e.g., *DOE’s Use of Federal Power Act Emergency Authority*, DOE, <https://www.energy.gov/oe/services/electricity-policy-coordination-and-implementation/other-regulatory-efforts/does-use>.

PJM nuclear assets that are scheduled (but not certain) to retire several years from now, in 2020–2021. The Request also cites FirstEnergy’s long-anticipated bankruptcy filings and its general frustration with the fact that competitors are outperforming its generators in PJM markets.⁸ Long-term trends, possible future retirements, and FirstEnergy’s dissatisfaction with its declining profits do not constitute a “sudden” “emergency” within the meaning of section 202(c). Retirements of uncompetitive coal-fired and nuclear generators are the result of economics, the natural evolution of technology, and shifts in policy.⁹ Such trends are natural in a competitive market, and are far from the wartime disturbances or other unforeseen events contemplated in section 202(c).¹⁰ The Secretary’s use of section 202(c) authority to interfere with the operation of competitive electricity markets in order to privilege certain fuels or suppliers would represent a dramatic expansion of the Secretary’s emergency authority.¹¹

II. Impending and Uncertain Generator Retirements Pose No Immediate Threat.

As the Federal Energy Regulatory Commission (“Commission”) and PJM have confirmed, impending coal-fired and nuclear generator retirements pose no emergency threat to power supply in PJM or elsewhere.¹² PJM’s performance during recent extreme winter weather affirms this.¹³

The Request relies heavily on a single National Energy Technology Laboratory study (“NETL Study”) concluding that demand in PJM during the December 2017–January 2018 cold snap (the “Cold Snap”) “could not have been met without coal.”¹⁴ But the NETL Study’s analysis has critical defects. It mistakenly concludes that coal-fired generation was critical to reliability because coal-fired generation disproportionately increased during the Cold Snap. Actually, this increase was due to the fact that more expensive and less efficient plants, such as the coal-fired plants identified in the study, are only dispatched when demand is high—not due to any attributes particular to coal-fired generation.¹⁵ The NETL Study’s conclusion fails to

¹⁵ See ALISON SILVERSTEIN, ROB GRAMLICH, & MICHAEL GOGGIN, GRID STRATEGIES LLC, A CUSTOMER-FOCUSED

account for a key fact: that certain resources were dispatched is not evidence the system lacked (or will lack during future events) other resources that could have been called upon instead to meet market demand and maintain reliability.

The Request cites the defective NETL Study as evidence that a whole category of coal-fired and nuclear generators should be subsidized by electric customers at above-market rates for a multi-year period (or perhaps indefinitely).¹⁶ FirstEnergy's depiction of system performance and needs is deeply flawed. The system's preparedness for, and relatively modest price spikes during, the Cold Snap reflect significant actions PJM and other Northeast and Mid-Atlantic grid operators have taken to improve winter reliability since the 2014 Polar Vortex.¹⁷ PJM has more than enough capacity to meet demand, even in extreme weather.¹⁸ Notably, coal-fired and nuclear generators were not immune from outages during the Cold Snap, while other resources such as hydro, wind, and natural gas played vital roles in maintaining reliability.¹⁹ There is no evidence that a system with fewer coal-fired and nuclear generators, following such generators' orderly exit from the markets, would perform worse during future extreme weather events.²⁰

The Request claims, without support, that “[u]nless immediate action is taken,” PJM is “likely” to experience “load-shedding (or worse).”²¹ Yet, PJM recently sent a letter to the Secretary “stat[ing] without reservation there is no immediate threat to system reliability” should the FirstEnergy units retire as announced, and further, should PJM identify any reliability issues, it has “a range of tools available . . . to induce assets to remain temporarily on-line.”²² Per its standard, Commission-approved procedures, PJM responded to FirstEnergy's announced retirements by analyzing system reliability. PJM concluded that impending generator

FRAMEWORK FOR ELECTRIC SYSTEM RESILIENCE 7 (2018), available at <https://tinyurl.com/y9b4347t> (“No single unit or type of generation is critical or resilient in itself. . . . There is no evident need to compensate generators or other assets for bulk power system resilience beyond the engineering-based reliability services already being procured.”).

¹⁶ See Request at 4–9, 32.

¹⁷ See, e.g., *January's Cold Weather Affects Electricity Generation Mix in Northeast, Mid-Atlantic, U.S.* ENERGY INFORMATION ADMIN. (Jan. 23, 2018), <https://www.eia.gov/todayinenergy/detail.php?id=34632>.

¹⁸ See *Update: PJM System Performing in Winter Storm Grayson*, PJM INSIDE LINES (Jan. 4, 2018), <https://tinyurl.com/yangm9wj> (“During the cold weather, PJM has had adequate power supplies and maintained operating reserve margins. There have been no concerns with fuel availability.”).

¹⁹ See PJM INTERCONNECTION, PJM COLD SNAP PERFORMANCE DEC. 28, 2017 TO JAN. 7, 2018 13–21 (2018), available at <https://tinyurl.com/ycetjvag>; *Update 2 – Entergy Shuts Massachusetts Pilgrim Nuclear Plant During Blizzard*, REUTERS, Jan. 4, 2018, <https://tinyurl.com/y7smj9b3> (reporting that ISO New England's system performed well during the Cold Snap even with very little coal-fired generation and despite shutdown of the 688-megawatt Pilgrim nuclear power plant due to downed power lines).

²⁰ Cf. *Grid Reliability and Resilience Pricing*, 162 FERC ¶ 61,012 (2018) (Glick, C., concurring) (stating there was “no evidence in the record to suggest that temporarily delaying the retirement of uncompetitive coal and nuclear generators would meaningfully improve the resilience of the grid”).

²¹ Request at 9. See also *id.* at 27.

²² See PJM Comments at 1.

retirements pose no immediate threat.²³ In sum, there is no indication, in the Request or otherwise, that Secretarial action is necessary or appropriate at this time.²⁴

III. The Requested Order Would Increase Prices and Pollution and Undermine State Energy Policies, With No Clear Reliability Benefits.

FirstEnergy's requested order would impose substantial, unreasonable costs on electric customers and the public, with no demonstrable system benefits. The Request provides no assessment of customer costs or the value of the so-called "fuel security and diversity" benefits of coal-fired and nuclear generators.²⁵ As outlined in separate comments submitted to the Commission by certain of the undersigned Attorneys General together with state agencies and consumer advocates (attached hereto as *Exhibit A*), subsidizing uneconomic generators at above-market rates would raise prices and force customers to bear the very economic risks that wholesale markets were designed to avoid. Furthermore, the requested section 202(c) order would undermine state policies to protect public health and ratepayers, including choices to promote renewable and alternative energy generation. Prolonging the operation of uncompetitive coal-fired power plants that would otherwise be replaced by cleaner resources would harm air quality and threaten progress toward our states' climate and clean energy goals.²⁶

* * * *

In general, the undersigned Attorneys General vehemently oppose extraordinary federal measures in response to FirstEnergy's Request or other section 202(c) applications, or action under the Defense Production Act.²⁷

For all of the foregoing reasons, the undersigned Attorneys General respectfully urge the Secretary to **DENY** FirstEnergy's legally flawed Request.

Please do not hesitate to contact us should you wish to engage us further in this matter.

²³ See Transmission Expansion Advisory Comm., PJM, Generation Deactivation Notification Update (May 3, 2018), available at <https://tinyurl.com/y7pjk9j>.

²⁴ Furthermore, the requested order could conflict with action already underway in Commission Docket No. AD18-7, which the Commission initiated to evaluate the so-called resilience of the bulk power system. See *Grid Resilience in Regional Transmission Organizations and Independent System Operators*, 162 FERC ¶ 61,012 (2018).

²⁵ See Request at I.

I. Finalizing the Proposal Would Violate the Federal Power Act.....	3
II. The Proposal Violates the Commission’s Legal Rulemaking Obligations.	7
A. The Proposal Lacks a Factual and Evidentiary Basis, and Adopting It Would Therefore Be Arbitrary and Capricious.	8
B. The Proposal Is Fatally Lacking in the Meaningful Detail Necessary for Public Notice and Informed Public Comments.....	12
C. Both DOE’s Directives and the Commission’s Timeline for Considering the Proposal Prevent Participants from Commenting Fully on the Many Complex Issues Raised by the Proposal.	13
D. The Proposal Fails to Articulate a Reasoned Basis for Its Sweeping Changes to the Country’s Electricity Markets.....	14
III. The Proposal Is Unnecessary to Support System Reliability.....	20
IV. The Proposal Is Contrary to the Findings of the Department of Energy Staff Report and Other Credible Analyses.	26
A. The Staff Report Indicates that Electric System Reliability Is Adequate.	27
B. The DOE Staff Report Recommends Further Analysis of Resilience and Wholesale Market Changes, Not an Immediate Regulatory Intervention.	29
C. Other Studies Demonstrate that the Proposal’s Focus on “Baseload” Resources and Fuel Supply Is Flawed.....	30
D. The Proposal Is Not Responsive to the Circumstances of the Polar Vortex or Recent Extreme Weather Events.	33
V. The States’ Experiences with Clean Energy Development and the Retirement of Aging, Uneconomic Generation Demonstrates There is No Pressing Reliability or Resilience Crisis Warranting Extraordinary Federal Intervention.....	36
VI. The Proposal Poses a Serious Threat of Harm to the States and Excessive Costs for Ratepayers.	43
A. A Federal Mandate to Subsidize the “Fuel-Secure” Resources Will Significantly and Unnecessarily Raise Energy Costs for Consumers.	43

B.	The Proposal Undermines State Energy Laws and Policies.	44
C.	Federal Intervention to Prolong the Life of Coal-Fired Power Plants Will Exacerbate the Public Health and Environmental Harms Caused by Such Facilities.	51
CONCLUSION		52

The undersigned Attorneys General, state agencies, and state consumer advocates (the “State Commenters”) hereby submit these initial comments in response to the Federal Energy Regulatory Commission’s (the “Commission”) Notice, dated October 2, 2017, inviting comments on a proposed rule regarding “grid reliability and resilience pricing,” which was released by the Department of Energy (“DOE”) on September 29, 2017 and published in the Federal Register on October 10, 2017. 82 Fed. Reg. 46,940 (the “Proposal”).¹

The Proposal is unsupported by law, lacks any reasoned basis or grounding in any supporting factual record, contains no analysis of its costs, and would damage the country’s competitive power markets in a manner likely to impose unreasonable and unnecessary costs on electric customers and profoundly undermine state energy laws and policies. On behalf of our states and our residents, the State Commenters urge the Commission not to finalize the Proposal.²

SUMMARY

DOE asks the Commission to establish a new regulatory regime that requires electric customers to pay certain uneconomic generating resources their full cost of service, under new tariffs administered by the operators of the nation’s otherwise competitive wholesale markets. DOE asserts this is necessary to ensure system “resiliency,” a term that lacks any accepted or legal definition. Without providing *any* estimate of what the Proposal would cost electric customers, DOE urges the Commission to implement the Proposal before this coming winter, to

¹ On October 4, 2017, staff for the Commission issued a request seeking responses during the comment process to thirty questions about the Proposal.

² The State Commenters recognize the numerous state consumer advocates and state public utility commissions that are submitting complementary comments on behalf of ratepayers and other important constituencies.

avoid further retirements of coal and nuclear power plants that allegedly would retire without these payments.

DOE proposes these sweeping changes, but provides the Commission with no lawful basis to adopt the new tariff requirements. DOE does not analyze how its Proposal would affect the wholesale electricity markets, provides no assessment of the Proposal's costs, makes no attempt to define or quantify the Proposal's benefits, and provides no support for making such a dramatic change on an expedited basis. DOE fails to show (or even argue) that the current regulatory construct is unjust and unreasonable, a finding the Federal Power Act requires for the Commission to take the proposed action.

The State Commenters oppose the Proposal for several reasons, which are explained in the detailed comments below:

- The Proposal violates federal law by failing to incorporate a finding of unjust and unreasonable rates under section 206 of the Federal Power Act or to provide an assessment of the resulting costs, as is required for Commission action of this kind. *See pp. 3-7.*
- The Proposal violates the Administrative Procedure Act in two separate ways: (1) by failing to provide the public with adequate notice or reasonable time for meaningful input and (2) by failing to explain or provide record support for its drastic regulatory changes, which are inconsistent with the Commission's long-standing commitment to competitive wholesale electric markets as an essential mechanism under the Federal Power Act to ensure just and reasonable rates, as well as with its efforts to refine those markets through responsive and inclusive

processes in conjunction with Regional Transmission Organizations (“RTOs”) and their stakeholders. *See* pp. 7-20.

- The Proposal’s underlying assumption—that electric system reliability or “resilience” is in danger because aging, uneconomic resources are retiring—is wrong. Under the Commission’s leadership, the bulk power system is reliable today and will continue to be so in the future. Both DOE’s own recent Staff Report and other independent analyses confirm that the risks that supposedly justify the Proposal are manageable and do not justify emergency action favoring particular fuels, but rather counsel for study of continued development of fuel-neutral solutions. Moreover, as independent analyses and state experience show, there is no evidence supporting the conclusion that retirement of aging resources or fuel supply issues are jeopardizing electric system reliability, and, to the contrary, clean energy resources and new technologies, coupled with market mechanisms, can serve future needs. *See* pp. 20-43.
- Last, the Proposal will pose unnecessary and unacceptable risks of harm to the States and their residents. The Proposal would drive up ratepayer costs; thwart state energy policies that support competition, innovation, and reduced air pollution; and impede state progress in addressing the risks of climate change. *See* pp. 43-52.

DETAILED COMMENTS

I. Finalizing the Proposal Would Violate the Federal Power Act.

The Federal Power Act requires that “[a]ll rates and charges . . . by any public utility for or in connection with the transmission or sale of electric energy . . . and all rules and regulations

affecting or pertaining to such rates or charges” must be “just and reasonable” and not “undu[ly] preferen[tial].” 16 U.S.C. § 824d(a), (b).³ Where, as here, the Commission is considering imposing new tariff requirements on public utilities, the Commission must invoke section 206 and prove that existing rates are “unjust, unreasonable, unduly discriminatory or preferential,” and then “determine the just and reasonable rate.” 16 U.S.C. § 824e(a); *see* 16 U.S.C. § 824e(b); *Advanced Energy Mgmt. Alliance v. FERC*, 860 F.3d 656, 662–63 (D.C. Cir. 2017) (under section 206, Commission has “burden to prove the reasonableness of its change” in affirming Commission’s section 206 finding in *PJM Interconnection, LLC*, 151 FERC ¶ 61,208, *order on reh’g*, 155 FERC ¶ 61,157 (2016) (internal quotation omitted)). As the D.C. Circuit has ruled, the Commission “may unilaterally impose a new rate scheme on a utility or Regional Transmission Organization only under [section 206],” *NRG Power Mktg., LLC v. FERC*, 862 F.3d 108, 114 n.2 (D.C. Cir. 2017), and “it will ordinarily be an abuse of the Commission’s discretion not to make the . . . finding [that existing rates are unjust or unreasonable under section 206] explicit.” *Papago Tribal Util. Auth. v. FERC*, 723 F.2d 950, 958 (D.C. Cir. 1983) (Scalia, J.); *see also Maine v. FERC*, 854 F.3d 9, 24-25 (D.C. Cir. 2017) (discussing the Commission’s burden under section 206).

The Proposal wholly fails to meet the section 206 standard for Commission action. Most glaringly, it does not articulate any finding that wholesale rates are now unjust, unreasonable, or unduly discriminatory or preferential. Instead it confirms that rates are, consistent with recent

³ The Proposal states that the Commission’s authority to adopt the proposed regulations arises from sections 205 and 206 of the Federal Power Act, 16 U.S.C. §§ 824d, 824e. Proposal at 46,941. Section 205, however, applies to Commission evaluation of rate filings by public utilities, such as market rule changes proposed in the first instance by RTOs, and the Commission plays “an essentially passive and reactive role” in making decisions under that section. *NRG Power Mktg., LLC v. FERC*, 862 F.3d 108, 115 (D.C. Cir. 2017) (quoting *City of Winnfield v. FERC*, 744 F.2d 871, 875-76 (D.C. Cir. 1984)).

Commission determinations on RTO market rules, currently just and reasonable. Proposal at 46,946 (“implementation of these reforms is important to ensure rates *remain* just and reasonable” (emphasis added)). As a matter of law, therefore, in light of the Proposal’s recognition that rates currently are just and reasonable, the Commission may not impose any new tariff requirements, since it cannot satisfy its section 206 burden.

In place of a section 206 finding, the Proposal rests on allegations of supposed “threats to grid reliability and resilience” from the “continued loss of fuel-secure generation [resources],” which the Proposal says are “necessary to maintain the resiliency of the electric grid.” Proposal at 46,945. Yet the term “resilience” and its sister terms “resiliency” and “fuel secur[ity]” have no clear definition in the Proposal or in law. *See infra* note 8. And even the term “reliability” provides no stand-alone support for taking action because, “when [the Commission] chooses to refer to non-cost factors in rate setting [under the Federal Power Act], it must . . . offer a reasoned explanation of how the [relevant] factor[s] justif[y] the resulting rates.” *TransCanada Power Mktg. Ltd. v. FERC*, 811 F.3d 1, 13 (D.C. Cir. 2015) (quoting *Farmers Union Cent. Exch., Inc. v. FERC*, 734 F.2d 1486, 1502 (D.C. Cir. 1984)).⁴ Because the Proposal fails to set forth any specific section 206 findings demonstrating why current wholesale rates are unjust and unreasonable as they relate to electric grid reliability and “resilience,” the Proposal does not satisfy the requirements of the Federal Power Act and should be rejected on that basis.

Likewise, the very purpose of the Proposal is to impose additional costs on RTOs and the load they serve, yet it makes *no* attempt to address, analyze, characterize, or quantify those

⁴ *See also PJM Interconnection*, 155 FERC ¶ 61,157, 2016 WL 2752930, at *94 (Chairman Bay, dissenting) (“talismanic invocation of reliability is, by itself, inadequate to establish reasoned decision making and just and reasonable rates”).

costs.⁵ Without that information, the Commission cannot make an informed decision that rates resulting from the Proposal will be just and reasonable, as the Federal Power Act requires. *See, e.g., TransCanada Power Mktg.*, 811 F.3d at 11 (without information about portion of reliability program’s costs attributable to profits and risk premiums, Commission “could not properly assess whether the Program’s rates were just and reasonable”); *cf. Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) (“Consideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages *and* the disadvantages of agency decisions.”).

Not only does the Proposal fail to provide any lawful basis for imposing new tariffs, it also appears to be inconsistent with the requirements of other Federal Power Act standards. Because the Proposal presents the potential for favored resources to receive the windfall of “full” cost-of-service treatment for energy, capacity, and ancillary services that the markets could procure at a lower cost, the Proposal could result in “excessive prices” to the detriment of consumers, in violation of the “just and reasonable” standard and the purposes of the Federal Power Act. *FERC v. Elec. Power Supply Ass’n*, 136 S. Ct. 760, 781 (2016) (“The statute aims to protect ‘against excessive prices’” (quoting *Penn. Water & Power Co. v. FPC*, 343 U.S. 414, 418 (1952).)); *TransCanada Power Mktg.*, 811 F.3d at 12 (statute forbids “excessive profits”); *Pub. Sys. v. FERC*, 606 F.2d 973, 979 n.27 (D.C. Cir. 1979) (Federal Power Act “aim[s] to protect consumers from exorbitant prices and unfair business practices,” as reflected in “statutory

⁵ In recent Congressional testimony, Secretary Perry failed to respond to the question whether DOE analyzed the costs of the Proposal and stated that “[T]he cost effective argument on this is secondary to whether the lights are going to come on I think you take costs into account, but what’s the cost of freedom? . . . What is the cost to build a system to keep America free?” Gavin Bade, *Perry on DOE NOPR pricetag: ‘What’s the cost of freedom?’*, Utility Dive (Oct. 12, 2017), at <http://www.utilitydive.com/news/perry-on-doe-nopr-pricetag-whats-the-cost-of-freedom/507174/>.

requirement that rates be just, reasonable, and nondiscriminatory”). In addition, the Proposal would violate the Federal Power Act to the extent that it would have FERC unduly discriminate in wholesale ratemaking by arbitrarily favoring coal and nuclear power plants over other resources that could provide similar or superior system services or attributes at a lower cost. *See, e.g., Elec. Consumers Res. Council v. FERC*, 747 F.2d 1511, 1515 (D.C. Cir. 1984) (rates must “be non-discriminatory and non-preferential[,] as well as just and reasonable”).

II. The Proposal Violates the Commission’s Legal Rulemaking Obligations.

The Proposal is not lawful rulemaking. In both its content and in the expedited comment process the Commission is following to consider it, the Proposal is not designed to provide the “reasoned decision-making” required in the Federal Power Act context. The Proposal reflects no effort to gather a record of material facts, and therefore the Commission is compromised in its duty to “weigh[] competing views, select[] a compensation formula with adequate support in the record, and intelligibly explain[] the reasons for making [its] choice.” *Elec. Power Supply Ass’n*, 136 S. Ct. 784; *see also Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (agency must “articulate a satisfactory explanation for its action[,] including a ‘rational connection between the facts found and the choice made’” (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962))).

The Proposal lacks the substantive content or supporting factual record that would permit informed and responsive comments from the public. Moreover, the short period afforded for public comment on a regulatory change of such significant consequence as the Proposal allows insufficient time meaningfully to respond to Commission staff’s voluminous questions.⁶ More

⁶ A recent Commission rulemaking on a much narrower topic provided a combined 141 days for comments from the publication of three requests for comments in the Federal Register, with additional days between issuance of the Commission requests and Federal Register publication.

fundamentally, the Proposal does not recognize or explain the profound changes its proposed tariff requirements would make in the Commission's approach to establishing just and reasonable rates, regulating the wholesale electric market, or the potentially significant impact on consumers. For these reasons, the Proposal should go no further.

A. The Proposal Lacks a Factual and Evidentiary Basis, and Adopting It Would Therefore Be Arbitrary and Capricious.

A threshold problem with the Proposal is that it has virtually no supporting factual record of its own. The Proposal is accompanied on the docket by a letter from DOE Secretary Rick Perry, a list of questions from Commission staff, and no other supporting information. While the preamble collects a variety of excerpts from official and other technical reports and from past and ongoing Commission proceedings, none of those references supports the statements in the preamble that allege the Proposal is necessary. In particular, there is no evidentiary support in the references for the Proposal's central premise: that the "premature" retirement of certain "fuel-secure" power plants, coupled with other generators' lack of a 90-day fuel supply, is harming electric system reliability or "resilience" and threatening national security. In fact, existing evidence contradicts this assumption, as discussed in more detail in Sections III through V below.

Although the Proposal purports to rely on the "extensive record" that the Commission and other agencies have developed on the subject matter, Proposal at 46,941, it includes no direct

See Essential Reliability Servs. & the Evolving Bulk-Power Sys. – Primary Frequency Response, Notice of Inquiry, 154 FERC ¶ 61,117 (Feb. 18, 2016) (60 days from Federal Register publication to provide comments, including responses to Commission questions); Notice of Proposed Rulemaking, 157 FERC ¶ 61,122 (Nov. 17, 2016) (60 days from Federal Register publication); Notice of Request for Supplemental Comments, 160 FERC ¶ 61,011 (Aug. 18, 2017) (21 days from Federal Register publication); *see also Winter 2013-2014 Operations & Mkt. Performance in Reg'l Transmission Orgs. & Indep. Sys. Operators*, 149 FERC ¶ 61,145 (Nov. 20, 2014) (90 days for RTO responses to questions).

explanation of what evidence in that record supports the need for the Proposal. For example, the Proposal quotes DOE's January 2017 Quadrennial Energy Review ("January 2017 QER")⁷, including an italicized statement that "the increased importance of system resilience to overall grid reliability *may* require adjustments to market mechanisms that enable better valuation." Proposal at 46,943 (emphasis added). This general statement does not reference any emergency, crisis, or actual need to make significant market changes, nor does it identify fuel security as a key element of "resilience."⁸ The January 2017 QER includes extensive recommendations to address electric system resilience, none of which includes establishing cost-of-service rates for the resources identified in the Proposal. *See, e.g.*, January 2017 QER at 4-1 to 4-55 (no mention of "fuel security").

The Proposal then quotes a May 2017 letter to DOE from the North American Electric Reliability Corporation ("NERC") stating that the changing operating characteristics of the bulk power system "must be well understood and properly managed." That letter does not appear in this rulemaking docket, but is available online.⁹ While the NERC letter identifies retirement of certain generating assets as implicating reliability, it *does not* recommend assuring cost recovery for the resources identified in the Proposal. Instead, the letter requests that the Commission and states conduct a *review* of the economic and policy issues related to retirements. The Proposal

⁷ U.S. Department of Energy, Quadrennial Energy Review – Transforming the Nation's Electricity System: The Second Installment of the QER (Jan. 2017), *available at* <https://energy.gov/sites/prod/files/2017/02/f34/Quadrennial%20Energy%20Review--Second%20Installment%20%28Full%20Report%29.pdf> ("January 2017 QER").

⁸ The January 2017 QER states that "[t]here are no commonly used metrics for measuring grid resilience." January 2017 QER at S-13. In other words, there currently is no quantifiable standard by which to determine either the qualities or the services that will be rewarded under the Proposal by full cost-of-service rates for the Proposal's favored resources.

⁹ *At* https://www.eenews.net/assets/2017/10/03/document_ew_01.pdf.

then makes similar unfounded analytical leaps from DOE's own August 2017 Staff Report¹⁰ to the conclusion that there is a "resiliency" emergency, which will be addressed in more detail below.

Finally, the Proposal includes a description of various Commission proceedings concerning reliability and price formation in wholesale markets dating to 2013. Despite this long record of Commission action, including various orders to strengthen the markets and set "just and reasonable" rates for RTOs and other market participants, the Proposal nonetheless concludes that the very reliability-related market issues the Commission has been addressing in the cited dockets are not being addressed adequately. Without citation or authority, the Proposal states that certain market deficiencies are "undermining reliability and resiliency," Proposal at 46,944, that "the fundamental challenge of maintaining a resilient electric grid has not been sufficiently addressed by the Commission or the ISOs and RTOs," and the "continued loss of fuel-secure generation must be stopped," Proposal at 46,945. Importantly, this unsupported rationale is contradicted by DOE's own findings as set forth in its August 2017 Staff Report, which concluded that wholesale electric markets "are currently functioning as designed—to ensure reliability and minimize the short term costs of wholesale electricity—despite pressures from flat demand growth, Federal and state policy interventions, and the massive economic shift in the relative economics of natural gas compared to other fuels." DOE Staff Report at 10. Moreover, nowhere in that report does DOE recommend, or even identify as an option,

¹⁰ Department of Energy, Staff Report to the Secretary on Electricity Markets and Reliability (Aug. 2017), *available at* https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf ("DOE Staff Report").

subsidizing the generation identified in the Proposal through a federal guarantee of full cost recovery. *See id.* at 126-27.

The lack of factual support for the Proposal extends to the details of its proposed tariffs, including their applicability solely in regions within a Commission-approved ISO or RTO with a day-ahead market, real-time market, and capacity market,¹¹ its 90-day fuel requirement for eligible resources, and its exclusion of resources subject to cost-of-service regulation by states. *See* Proposal at 46,948. Cost-of-service ratemaking, ordinarily reserved for monopoly services, involves specific accounting rules, including specifying the sources of data, accounting for taxes, the treatment of transaction-related costs, asset retirement, lobbying and advertising expenses, and allocation of costs among jurisdictions and functions.¹² The Proposal contains no discussion of, or support for, the inclusion of any of these specific provisions.

In sum, the preamble to the Proposal and the references that it cites include no factual support for the Proposal in general and lack support for its specific provisions to implement cost-of-service ratemaking. These blatant defects make any effort to finalize the Proposal arbitrary and capricious and thus violate the requirements for Commission decision-making under the Federal Power Act, the Administrative Procedure Act, and governing case law. *See Elec. Power Supply Ass'n*, 136 S. Ct. at 784; *Motor Vehicle Mfrs. Ass'n*, 463 U.S. at 43.

¹¹ The versions of the Proposal attached to Secretary Perry's letter to the Commission and posted in this rulemaking docket do not contain this last limitation, but the version published in the Federal Register does. *See* 82 Fed. Reg. 46,940, 46,948 (Oct. 10, 2017). According to an errata notice, the Commission is seeking comment on the version in the Federal Register.

¹² *See, e.g.*, Commission Staff's Guidance on Formula Rate Updates (2014), *available at* <https://www.ferc.gov/industries/electric/indus-act/oatt-reform/staff-guidance.pdf>; *see also, e.g.*, PJM Interconnection, PJM Open Access Transmission Tariff, Docket No. ER17-2232-000, at 1580-1608, *available at* <http://www.pjm.com/directory/merged-tariffs/oatt.pdf> (annual transmission rates for Commonwealth Edison Company Network Integration Transmission Service).

B. The Proposal Is Fatally Lacking in the Meaningful Detail Necessary for Public Notice and Informed Public Comments.

The Proposal seeks to remake the wholesale electric markets to assure that certain resources fully recover from ratepayers their costs and guaranteed returns on their investments, despite the fact that those resources are no longer economically competitive. But the Proposal gives only the most generic guidance on how that recovery should occur and on what terms. Indeed, the proposed regulatory language is less than one page and provides no definitions of key terms like “resiliency,” “emergency,” “90-day fuel supply,” “fuel-assurance,” or “fully allocated costs and a fair return on equity.” *See* Proposal at 46,948. The preamble states the Proposal’s “crisis” rationale in conclusory fashion, without any record citations or evidence to indicate that the proposed action is necessary. *See* Proposal at 46,941-42.

This is not fair public notice. The Proposal is deficient on its face for failing to “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.” *Am. Water Works Ass’n v. EPA*, 40 F.3d 1266, 1274 (D.C. Cir. 1994) (citation omitted). Further, it would be improper for the Commission to develop a *post-hoc* rationale for the Proposal through assembly of a record during the comment period or thereafter; the rulemaking proposal itself must provide notice of the *agency’s* rationale and record support. *See* Hon. Harry T. Edwards et al., *Federal Standards of Review: Review of District Court Decisions and Agency Actions* ch. XIII.E (2013) (citing *Ass’n of Private Sector Colls. & Univs. v. Duncan*, 681 F.3d 427, 462 (D.C. Cir. 2012)); *Chamber of Commerce v. SEC*, 443 F.3d 890, 900 (D.C. Cir. 2006) (“By requiring the ‘most critical factual material’ used by the agency be subjected to informed comment, the [Administrative Procedure Act] provides a procedural device to ensure that agency regulations are tested through exposure to public comment, to afford affected parties an opportunity to present comment and evidence to support their positions, and thereby to

enhance the quality of judicial review.”). In this case, DOE drafted the Proposal, and the Proposal’s deficiencies are attributable to DOE. It is the Commission’s duty to decline to proceed with such a sweeping rulemaking on notice that is so deficient and vague.

C. Both DOE’s Directives and the Commission’s Timeline for Considering the Proposal Prevent Participants from Commenting Fully on the Many Complex Issues Raised by the Proposal.

The deadline for initial comments on the Proposal is set for 21 days following the Commission’s public notice, 19 days after Commission staff posted a detailed list of thirty questions about the Proposal, and a mere 12 days following the publication of the Proposal in the Federal Register, with reply comments due only 14 days later. This timeline closes the comment period on the Proposal in less than the 30-day post-publication period that is typically the bare minimum afforded for federal rulemaking, and far less than the 90 to 180 day comment periods, often preceded by Advance Notices of Proposed Rulemaking and their own comment periods, that major rulemaking proposals often require.¹³ The Commission’s denial of the many requests for an extension of the comment period, without supporting reasons, has compounded the prejudice to commenters. Moreover, given the vast volume of public comments expected on the Proposal, the Commission should allow more than a mere 14 days to file comments replying to the expected deluge of initial comments.

In this regard, DOE’s directive to take final action on the Proposal within 60 days also

¹³ See *supra* note 6; cf. Executive Order No. 12,866, 58 Fed. Reg. 51,735, § 6(a) (1993) (“[E]ach agency should afford the public a meaningful opportunity to comment on any proposed regulation, which in most cases should include a comment period of not less than 60 days.”); Office of the Federal Register, A Guide to the Rulemaking Process (2011), at https://www.federalregister.gov/uploads/2011/01/the_rulemaking_process.pdf (“In general, agencies will specify a comment period ranging from 30 to 60 days. . . For complex rulemakings, agencies may provide for longer time periods, such as 180 days or more.”).

improperly impinges on the Commission's responsibility to act in a deliberative and independent manner in accordance with the Department of Energy Organization Act. *See, e.g.*, 42 U.S.C. § 7173(b) (Commission has "exclusive jurisdiction" with respect to any proposal and shall act within "reasonable time limits"); *id.* § 7173(c) (Commission's use of rulemaking procedures to set rates under Federal Power Act procedures "shall assure full consideration of the issues and an opportunity for interested persons to present their views"); *id.* § 7171(d) ("In the performance of their functions, the members, employees or other personnel of the Commission shall not be responsible to or subject to the supervision or direction of any officer, employee or agent of any other part of" DOE.).

D. The Proposal Fails to Articulate a Reasoned Basis for Its Sweeping Changes to the Country's Electricity Markets.

In guaranteeing "full" cost recovery for a group of preferred resources, regardless of market outcomes, the Proposal would decisively break from the Commission's longstanding reliance on competitive wholesale markets to secure just and reasonable rates. As the Supreme Court has recently recognized, the Commission "undertakes to ensure 'just and reasonable' wholesale rates by enhancing competition—attempting . . . 'to break down regulatory and economic barriers that hinder a free market in wholesale electricity.'" *Elec. Power Supply Ass'n*, 136 S. Ct. at 768 (quoting *Morgan Stanley Capital Grp. v. Pub. Util. Dist. No. 1 of Snohomish Cnty.*, 554 U.S. 527, 536 (2008)); *see also* *Midwest Indep. Transmission Sys. Operator, Inc.*, 108 FERC ¶ 61,163 at P 371 n. 226 (2004) ("The Commission favors market design remedies, where possible, to provide needed revenues to support reliability-based generators and other needed investments.").

The Proposal contravenes decades of Commission precedent establishing and strengthening competition in the country's wholesale electric markets. Pursuant to Order 888, the

Commission required open access to transmission services, the foundation necessary for competitive wholesale electric markets in the United States. Order No. 888, *Promoting Wholesale Competition Through Open-Access Non-discriminatory Transmission Servs. by Pub. Utils.*, 61 Fed. Reg. 21,540 (May 10, 1996), *aff'd in part, rev'd in part*, 225 F. 3d. 667 (D.C. Cir. 2000), *aff'd sub nom. New York v. FERC*, 535 U.S. 1 (2002). Prior to the Commission's restructuring of the market under Order 888 and its successors, electricity delivery and supply were treated as monopoly services.¹⁴ Rates were based on cost-of-service rate-of-return ratemaking, which in some cases resulted in inefficient investment decisions and excessive costs.¹⁵ There was little competition among generators and no market discipline brought to bear on a generator's prices or costs. In many cases, ratepayers were saddled with the full costs of expensive and often over-budget power plants, and bore the downside risks that vertically integrated utilities incurred. See National Renewable Energy Laboratory, *Competitive Electricity Market Regulation in the United States: A Primer* at 9 (2016), at <https://www.nrel.gov/docs/fy17osti/67106.pdf> (hereinafter, "Competitive Electricity Market Regulation") (citing utility "overbuilding of [generation] capacity and the concomitant capital costs, [which] triggered rate increases," "utility mismanagement," and "lax regulatory oversight").¹⁶

¹⁴ In many states, electricity delivery and supply remain bundled and subject to cost-of-service regulation. However, the Proposal would exclude those resources from the rule. Proposal at 46,948, proposed rule § 35.28(g)(10)(i)(E).

¹⁵ The seminal work addressing the perverse incentives favoring inefficient investment ("gold-plating") as a result of cost-of-service regulation is the paper by Harvey Averch and Leland L. Johnson, *Behavior of the Firm Under Regulatory Constraint*, AM. ECON. REV., Vol. 52, No. 5, pp. 1052-1069 (Dec. 1962). The "Averch-Johnson" effect has been widely discussed in regulatory decisions at both the state and federal levels.

¹⁶ These features are not inevitable results of cost-of-service regulation of utility assets within the context of least-cost integrated resource planning and careful review of regulated utilities and

In issuing Order 888, the Commission's express goal was "to ensure that customers have the benefits of competitively priced generation." 61 Fed. Reg. at 21,550. Since its initial issuance of Order 888, the Commission has not wavered from its commitment to open wholesale electric markets and "the promise of an increasingly competitive commodity market in electric power, in which significant benefits to consumers can be achieved." *Id.* at 21,569. Many states, including certain states represented by the State Commenters, amended their state laws to replace the pricing of electricity through regulation with reliance on Commission-regulated wholesale electric markets to set the price of electricity.¹⁷

As part of the its implementation of competitive wholesale electric markets, the Commission consistently has promoted greater competition to benefit electric customers and, among other reforms, strongly has encouraged the organization of regional markets administered by independent system operators, which now serve two-thirds of the nation's electric customers. *See* Competitive Electricity Market Regulation at 9; *see also* Order No. 2000, *Regional Transmission Orgs.*, 89 FERC ¶ 61,285 (Dec. 20, 1999).¹⁸ According to the Commission, "[e]ffective wholesale competition protects consumers by providing more supply options, encouraging new entry and innovation, spurring deployment of new technologies, promoting

their costs by utility commissions, as evidenced by the successful regulatory regimes that govern transmission at the federal level and distribution (and in some states, generation) at the state level. The success of state regulation depends on the application of appropriate rules and fair procedures to govern the establishment of rates.

¹⁷ In the PJM region, for example, the price for electricity rose in the 2000s and began to fall in 2009 as new technologies developed and competition imposed discipline on market participants. *See* Monitoring Analytics LLC, State of the Market Report for PJM, Vol. 1, at 17, Table 9 (Mar. 2017), available at http://www.monitoringanalytics.com/reports/PJM_State_of_the_Market/2016/2016-som-pjm-volume1.pdf.

¹⁸ *Order on reh'g*, Order No. 2000-A, 65 Fed. Reg. 810 (2000), *aff'd sub nom. Pub. Util. Dist. No. 1 of Snohomish Cnty. v. FERC*, 272 F.3d 607 (D.C. Cir. 2001).

demand response and energy efficiency, improving operating performance, exerting downward pressure on costs, and shifting risk away from consumers.” Order No. 719, *Wholesale Competition in Regions with Organized Elec. Mkts.*, 125 FERC ¶ 61,071 at P 1 (Oct. 17, 2008); *see also Midwest Indep. Transmission Sys. Operator, Inc.*, 108 FERC ¶ 61,163 at P 371 n.226 (“The Commission favors market design remedies, where possible, to provide needed revenues to support reliability-based generators and other needed investments.”). As a matter of Commission precedent, “[i]mproving the competitiveness of organized wholesale energy markets is therefore integral to the Commission fulfilling its statutory mandate to ensure supplies of electric energy at just, reasonable, and not unduly discriminatory or preferential rates.” Order No. 719 at P 1.

The Proposal turns this principle on its head by guaranteeing “full” cost recovery for certain preferred generation resources. *See* Proposal at 46,945 (“The rule allows the full recovery of costs of certain eligible units physically located within the Commission-approved organized markets [and] requires the organized markets to establish just and reasonable rate tariffs for the recovery of costs and a fair rate of return.”). Because those resources, unlike their competitors, would no longer need to recover their costs in the market, giving them “full” federally-guaranteed cost recovery would be a significant departure from the Commission’s policy of promoting competitive, fuel-neutral, non-discriminatory, and efficient wholesale markets. It could be justified, as part of the Commission’s statutory responsibilities, only, if ever, upon a clear showing of necessity to ensure electric system reliability. That showing has not been

made.¹⁹ Instead, electric customers would invariably have to pay those costs, regardless of how high they are, and customers will bear the investment risks now borne by resource owners.

The Proposal is profoundly different from state credit-based programs that incentivize utilities' procurement of particular resources. Those state programs neither guarantee full cost recovery, nor remove categories of resources from the competitive wholesale market. Rather, those programs are one means by which states exercise their traditional authority to regulate electric generation. *See* Section VI.B, *supra*.

As the Proposal is unmoored from specific and demonstrable reliability concerns or other legal authority, its preferential treatment of uncompetitive resources would also depart from the Commission's statutory obligation and longstanding position that wholesale electric markets should ensure an open and level playing field for generating and other resources. 16 U.S.C. §§ 824d(a), (b); *see, e.g., Indianapolis Power & Light Co.*, 158 FERC ¶ 61,107 at P 69 (2017) (market rules that "unnecessarily restrict[] competition" by excluding certain resources are "unjust, unreasonable, and unduly discriminatory or preferential"); Order No. 745, *Demand Response Compensation in Organized Wholesale Energy Markets*, 134 FERC ¶ 61,187 at P 59

¹⁹ The nation's RTOs are committed to preserving and strengthening competitive electric markets that ensure reliability. In the wake of the Proposal, this view was reaffirmed by ISO New England ("ISO-NE"), which has overseen and successfully managed substantial retirements of coal and nuclear resources in recent years. *See* Notice, ISO-NE, *Study on Regional Fuel Security to be Delayed Pending Resolution of DOE Proposal on Grid Resiliency Pricing* at 1 (Oct. 13, 2017), available at https://www.iso-ne.com/static-assets/documents/2017/10/20171013_fuel_security_analysis_delay_final.pdf ("ISO-NE Delay Notice") ("Competitive markets have worked effectively in New England to bring forward the resources needed to ensure reliable power system operations while reducing power system emissions and wholesale power prices. Reliability services can be provided by a wide range of resources and technologies, including those that have onsite fuel, and the ISO believes that the most efficient solution is to procure those services through a competitive market whenever feasible. Providing full cost recovery for certain technologies and not others will ultimately undermine the competitive wholesale market construct and lead to cost-of-service for all resources.").

(2011) (“removing barriers to demand response participation” in markets “facilitates greater competition”).²⁰

Such an irrational and unexplained departure from the Commission’s precedents would be unlawful. Under the Administrative Procedure Act, when an agency reverses existing policy, it must show a change in circumstances and policy and provide strong reasons for disregarding prior factual and policy conclusions. As the D.C. Circuit has recently explained, when reversing existing policy:

[T]he Supreme Court has held that “the [Administrative Procedure Act] requires an agency to provide more substantial justification when its new policy rests upon factual findings that contradict those which underlay its prior policy; or when its prior policy has engendered serious reliance interests that must be taken into account.” . . . “It is not that further justification is demanded by the mere fact of policy change[,] but that a reasoned explanation is needed for disregarding facts and circumstances that underlay or were engendered by the prior policy.” . . . “Put another way, ‘it would be arbitrary and capricious to ignore such matters.’”

U.S. Telecom Ass’n v. FCC, 825 F.3d 674, 708-09 (D.C. Cir. 2016) (citing *Elec. Power Supply Ass’n*, 136 S. Ct. at 784), *reh’g denied*, 855 F.3d 381 (D.C. Cir. 2017), *petitions for cert. filed* (U.S. Sept. 27, 2017) (No. 17-498 et al.); *see also* 5 U.S.C. § 706; *La. Pub. Serv. Comm’n v. FERC*, 184 F.3d 892, 894, 897 (D.C. Cir. 1999) (“arbitrary and capricious” for Commission to “without an explanation . . . depart[] from its own precedent” (citing *Motor Vehicle Mfrs. Ass’n*, 463 U.S. at 57)); *Mich. Pub. Power Agency v. FERC*, 405 F.3d 8, 16 (D.C. Cir. 2005) (remanding for further explanation where Commission failed to adequately explain new

²⁰ *Order on reh’g*, Order No. 745-A, 137 FERC ¶ 61,215 (2011), *reh’g denied*, Order No. 745-B, 138 FERC ¶ 61,148 (2012), *vacated sub nom. Elec. Power Supply Ass’n v. FERC*, 753 F.3d 216 (D.C. Cir. 2014), *rev’d & remanded sub nom. FERC v. Elec. Power Supply Ass’n*, 136 S. Ct. 760 (2016).

policy). The Proposal thus fails to address factual or policy changes that would justify a radical shift away from market pricing, does not recognize the consequences to parties that have placed “serious reliance” upon the wholesale market rules, and fails to meet the standard for reversing existing Commission policy.

III. The Proposal Is Unnecessary to Support System Reliability.

On its own terms, the Proposal is a solution for a problem that does not exist. First and foremost, there is no evidence that electric system reliability is in any present danger. As discussed below, DOE’s own staff report confirmed this reality earlier this year, *see* DOE Staff Report at 10 & *infra* Section IV.B, as did Commission staff in an October 19, 2017 report to the Commission providing its assessment of energy market conditions during the upcoming winter.²¹

Nor do the ongoing retirements of resources with on-site fuel present an emergency requiring immediate out-of-market Commission actions. With the Commission’s approval, numerous regional markets operate capacity and other markets to ensure that they have adequate generation resources to meet peak customer demand plus a reserve margin, and thus ensure system reliability over time. FERC Staff Report No. AD13-7-000, *Centralized Capacity Mkt. Design Elements*, at 2 (Aug. 2013), at <http://www.ferc.gov/CalendarFiles/20130826142258-Staff%20Paper.pdf> (“[T]he primary goal of each of these markets is the same: ensure resource adequacy at just and reasonable rates through a market-based mechanism that is not unduly discriminatory or preferential as to the procurement of resources.”). The capacity markets provide additional payments to generators and other resources to supplement energy revenues, in recognition of the fact that energy revenues alone may not be sufficient for some generators to

²¹ FERC Staff, Winter 2017-18 Energy Market Assessment (Oct. 19, 2017), *available at* <https://www.ferc.gov/market-oversight/reports-analyses/mkt-views/2017/10-19-17-A-3.pdf> (“Winter Energy Market Assessment”).

recover their costs and remain viable. *Id.* The Commission has reviewed the capacity market rules regularly in response to complaints and tariff filings, and, in recent years the Commission has approved modifications to capacity markets so that they compensate capacity based on availability and performance at times of high demand. *See, e.g., PJM Interconnection*, 155 FERC ¶ 61,157 at P 29 (Tying “resource compensation to a resource’s actual performance, is consistent with fundamental principles of fairness. Resources should be compensated in proportion to their performance.”).

The Proposal applies only to the RTOs that have established these capacity markets, apparently amounting to a judgment that those markets have wholly failed to meet their objectives and should be scrapped. Proposal at 46,948. To the contrary, these capacity markets are successful in procuring needed capacity to ensure system reliability in the regions where they operate.²²

- In 2016, ISO New England’s (“ISO-NE”) tenth annual capacity auction included stringent requirements to ensure resource performance at times of system stress, concluded at lower price than the previous auction, and procured sufficient resources, including three new conventional power plants, as well as capacity from solar and offshore and onshore wind facilities, to meet projected New England demand in 2019-2020.²³
- In PJM Interconnection’s (“PJM”) most recent capacity auction held in May 2017 and applicable in 2020-2021, the reserve margin for the entire RTO was 23.3%, that is, 6.7% higher than the target reserve margin of 16.6%. In other words, existing PJM resources exceed peak demand by 23.3%, demonstrating that there is sufficient reliable generation available to serve all customers in the PJM region. Moreover, in PJM capacity auctions covering 2017/2018 through 2020/2021, new generation and generation uprates (increased capacity) ranging from 2,823.8 megawatts (“MW”) to 6,267.3 MW cleared the auction. PJM further reports that

²² For information on capacity markets not discussed here, see the comments filed in this docket by certain State Commenters’ respective state utilities regulators.

²³ Press Release, ISO-NE, *Finalized Capacity Auction Results Confirm 10th FCA Procured Sufficient Resources, at a Lower Price, for 2019–2020* (Feb. 29, 2016), at https://www.iso-ne.com/static-assets/documents/2016/02/20160229_fca10_finalresults.pdf.

from 2007/2008 to 2020/2021, the net increase in installed capacity, including generation retirements and additions, demand response, and energy efficiency, equals 22,701 MW in the PJM region.²⁴

- In the Midcontinent Independent System Operator (“MISO”) region, the most recent offers of capacity exceeded the reserve margin by 5.5%, resulting in a region-wide price of \$1.50 per MW-day, reflecting the existence of more than sufficient generation resources to meet regional demand.²⁵

The fact that certain older, uneconomic resources do not clear the auctions and are retiring is not evidence that capacity markets are failing; to the contrary, these markets have ensured replacement of retiring resources with new capacity in a manner that has met regional installed capacity and reserve requirements and maintained system reliability.²⁶ Against this backdrop, there is no need for the Proposal, or anything similar, to safeguard system reliability.²⁷

²⁴ PJM, *2020/2021 RPM Base Residual Auction Results* at 2-3, 19 (2017), available at <http://www.pjm.com/~media/markets-ops/rpm/rpm-auction-info/2020-2021-base-residual-auction-report.ashx>.

²⁵ MISO, *2017/2018 Planning Resource Auction Results* at 5 (2017), available at <https://www.misoenergy.org/Library/Repository/Meeting%20Material/Stakeholder/RASC/2017/20170510/20170510%20RASC%20Item%2002a%202017-18%20PRA%20Summary.pdf>.

²⁶ See, e.g., *ISO New England Inc. and New England Power Pool Participants Comm.*, 158 FERC ¶ 61,138, at P 9 (2017) (“One purpose of capacity markets is to send appropriate price signals regarding where and when new resources are needed.”); *Long Island Power Auth. v. N.Y. Indep. Sys. Operator, Inc.*, 120 FERC ¶ 61,071, at P 14 (2007) (“the [capacity] market would benefit customers by encouraging the construction of new capacity”); *N.Y. Indep. Sys. Operator, Inc.*, 103 FERC ¶ 61,201, at P 36 (2003) (“NYISO’s analyses adequately demonstrate that the proposal will benefit customers because it will encourage the construction of new generation.”), *aff’d sub nom Elec. Conservation Res. Council v. FERC*, 407 F.3d. 1232 (2005); *ISO New England Inc.*, 148 FERC ¶ 61,201, 2014 WL 4637550, at *4 (2014) (LaFleur, concurring) (“Forward Capacity Market (FCM) plays a vital role in ensuring reliability in New England. [It] is the mechanism that ensures future system reliability by procuring capacity resources sufficient to meet New England’s resource adequacy needs.”).

²⁷ The Commission has preexisting tools to address short-term reliability issues that may arise from the retirement of a particular resource, including approval of reliability-must-run agreements with generators, which “should be of a limited duration so as to not perpetuate out-of-market solutions that have the potential, if not undertaken in an open and transparent manner, to undermine price formation” in the wholesale market. *N.Y. Indep. Sys. Operator, Inc.*, 150 F.E.R.C. ¶ 61,116 at P 2 (2015).

It is hard to envision how the Proposal could co-exist with capacity and other markets. With no incentive to recover fixed costs through markets, favored resources theoretically could recover both market and cost-based revenues, or rely exclusively on cost-based revenues and exit the market altogether, causing future auctions to fail. The Proposal would unacceptably undermine if not destroy the many years of hard work by the Commission, the RTOs, and market participants and stakeholders (including the States) to refine and adjust the capacity and other market constructs employed by the country's RTOs. The Commission should instead continue its longstanding efforts to work with RTOs and stakeholders to improve capacity and other markets.

Moreover, the Commission, the nation's RTOs, and other reliability organizations have already developed both markets and cost-based rates to compensate providers of power-related services that are necessary for reliability, such as black-start capabilities and spinning reserves. *See, e.g.,* Competitive Electricity Market Regulation at 14-15. These services have been addressed in established, deliberative processes that provide the opportunity for stakeholders, including generators, utilities, consumers, and the Commission, to participate in ensuring that the nation's electric grid meets the Commission-approved reliability standards promulgated under section 215 of the Federal Power Act, 16 U.S.C. § 824(o), which was enacted as part of the Energy Policy Act of 2005.

In contrast to the more inclusive processes approved by the Commission to address market issues, the Proposal reflects a top-down approach that departs from the decision-making process undertaken by the nation's RTOs, in collaboration with the States and other stakeholders. *See, e.g.,* Order No. 719 at P 477 (finalizing requirements for RTOs and ISOs that reaffirm importance of "responsiveness" by RTOs and ISOs, i.e., "willingness, as evidenced in its practices and procedures, to directly receive concerns and recommendations from customers and

other stakeholders, and to fully consider and take actions in response to the issues that are raised”). In the refinement of capacity markets and in many other areas, regional markets have institutionalized reliability and system planning within extensive stakeholder processes under the Commission’s oversight.²⁸

In past approaches to address the very fuel supply issues that the Proposal purportedly seeks to cure, the Commission has followed a more deliberative and bottom-up process to investigate potential market improvements. In 2016, for example, the Commission approved changes to the PJM capacity market as a part of its “broader effort, by the RTOs, market participants, and the Commission, to adapt the nation's wholesale electric markets to the underlying changes in how electricity is generated and ensure that reliability is sustained during and after that transition.” *PJM Interconnection*, 155 FERC ¶ 61,157, at P 25. The Commission stated:

[I]n recent years, the Commission has convened technical conferences specifically addressing the operation of wholesale capacity markets and the increasing importance of coordination between the electric and natural gas industries for the reliability of the nation's electricity supply. Those efforts have resulted in both regional market changes, such as ISO New England, Inc.’s Pay for Performance capacity market reforms (upon which PJM’s Capacity Performance program is modeled), and national changes to communication and coordination processes between the natural gas and electric industries.

²⁸ In general, stakeholder processes are recognized as vital contributors to the development of regional market rules. Mark James et al., *How the RTO Stakeholder Process Affects Market Efficiency*, R Street Policy Study No. 112, at 19 (October 2017), available at <http://www.rstreet.org/wp-content/uploads/2017/10/112.pdf> (“Stakeholder-governance processes are essential to the efficient development of market rules. Our research and interviews discovered a consensus that these processes are generally working well and serve the needs of the stakeholder community.”). State agencies, consumer advocates, and utility commissions generally have “seats at the table” and regularly participate in and influence these processes. *Id.* at 2, 11.

Id. See, e.g., Centralized Capacity Markets in Reg'l Transmission Organizations & Indep. Sys. Operators Winter 2013-2014 Operations & Mkt. Performance in Reg'l Transmission Orgs. & Indep. Sys. Operators, 149 FERC ¶ 61,145 at P 19 (2014) (providing “each RTO/ISO the opportunity to identify the fuel assurance issues most relevant to its markets and comprehensively describe the set of actions it has already undertaken or proposes to undertake to address these issues”).²⁹ Whether or not all stakeholders have agreed with the particular outcomes of these market initiatives, the joint efforts by RTOs, stakeholders, and the Commission to improve system reliability and market performance in the face of a changing resource mix reflect the fitness and durability of Commission oversight to address wholesale market challenges, including the alleged challenges described in the Proposal. The Proposal provides no reason for the Commission to depart from its practice of engaging market participants and other stakeholders through deliberative and inclusive inquiries that draw on

²⁹ RTOs continue to conduct analysis of these issues. ISO-NE is in the midst of completing a study regarding fuel security, and the Proposal has compelled it to indefinitely delay the study’s release and the subsequent stakeholder discussions of potential market changes to address any fuel security issues it identifies. *See* ISO-NE Delay Notice, *supra* note 19, at 2 (“The identification of appropriate market design improvements will be a complex undertaking and will require a systematic and deliberative regional process for examining the risks and potential solutions. The ISO planned to discuss the study results with stakeholders over the remainder of 2017 and into early 2018 and begin discussions of solutions after that process. The ISO’s goal has always been to work with stakeholders—market participants, regulators, policymakers, and others—to address New England’s unique fuel-security challenges through the wholesale market construct. However, the US DOE NOPR has raised the potential for significant changes to the wholesale electricity markets in the US. Therefore, the ISO has concluded that it is prudent to delay finalizing the study until the [Commission] has provided direction to the industry on how to interpret the DOE NOPR in the context of competitive wholesale markets. ISO New England intends to release the Operational Fuel-Security Analysis once the NOPR is sufficiently resolved.”).

RTO stakeholder processes that provide vital opportunities for the exchange of data and ideas prior to adopting market rule or pricing changes.³⁰

IV. The Proposal Is Contrary to the Findings of the Department of Energy Staff Report and Other Credible Analyses.

The Proposal relies heavily on the August 2017 DOE Staff Report on electric markets and reliability. *See* Proposal at 46,941. The bulk of the DOE Staff Report provides a summary of trends in the wholesale electric market, including the retirement of certain generation resources, the increasing use of low-cost natural gas, and the integration of variable energy resources like wind and solar.³¹ The report does not support the Proposal's dire characterization of the power sector, finding rather that the electric system is currently reliable. In general, the report recommends additional work on issues that the Commission is currently addressing and further study and review of electric system resilience. In sum, although the State Commenters do not necessarily endorse the findings and policy recommendations in the report, it suffices here to point out that the report does not support the Proposal's immediate and drastic regulatory intervention in the nation's wholesale markets. Moreover, other credible analysis shows that the Proposal's picture of an electric system under siege from "baseload" resource retirements,

³⁰ *See, e.g.*, PJM, Capacity Construct and Public Policy Senior Task Force, CCPPSTF Matrix (Oct. 16, 2017), *available at* <http://www.pjm.com/-/media/committees-groups/task-forces/ccppstf/20171016/20171016-ccppstf-matrix.ashx> (logging the development of interest identification, design criteria, key work activities, and capacity market rule change proposal packages relating to a two-tier capacity market to ensure adequate resources are procured by PJM's Reliability Pricing Model).

³¹ The DOE Staff Report responded to three issues posed by Secretary Perry in an April 2017 memorandum, namely, "[t]he evolution of wholesale electricity markets"; "[w]hether wholesale energy and capacity markets are adequately compensating attributes such as on-site fuel supply and other factors that strengthen grid resilience and, if not, the extent to which this could affect grid reliability and resilience in the future"; and "[t]he extent to which continued regulatory burdens, as well as mandates and tax and subsidy policies, are responsible for forcing the premature retirement of baseload power plants." DOE Staff Report at 1.

unreliable replacement resources, and extreme-weather disruptions to fuel supplies is simply not accurate.

A. The Staff Report Indicates that Electric System Reliability Is Adequate.

The DOE Staff Report expressly affirms the reality that the nation's bulk power system has successfully managed changing market conditions in recent years, including significant levels of retirements of certain resources, and is currently reliable. Specifically, the report confirms:

- “[Bulk power system] reliability is adequate despite the retirement of a portion of baseload capacity and unique regional hurdles posed by the changing resource mix.” DOE Staff Report at 11.
- “[Bulk power system] reliability is adequate today despite the retirement of 11 percent of the generating capacity available in 2002, as significant additions from natural gas, wind, and solar have come online since then. Overall, at the end of 2016, the system had more dispatchable capacity capable of operating at high utilization rates than it did in 2002.” *Id.* at 63.
- “To date, wholesale markets have withstood a number of stresses. While markets have evolved since their introduction, they are currently functioning as designed—to ensure reliability and minimize the short-term costs of wholesale electricity—despite pressures from flat demand growth, Federal and state policy interventions, and the massive economic shift in the relative economics of natural gas compared to other fuels.” *Id.* at 10.
- Over the longer term, “NERC reports that all regions project more than sufficient planning reserve margins. . . . [P]lanning reserve margins exceed their respective regional targets despite the loss of traditional baseload capacity since 2002.” *Id.* at 65. The DOE Staff Report contains a chart, *id.* at 66, showing these planning reserve margins through 2022:

Figure 4.2. Five-Year Average Reserve Margins across Different Regions (2018–2022)²³¹

The Proposal does not reference these findings, which confirm there is significant capacity above the RTO reserve margins and contradict its assertion that “immediate action is necessary” to ensure reliability. The DOE Staff Report also does not support the Proposal’s assertion that “immediate action is necessary” because further power plant retirements will cause “severe consequences,” Proposal at 46,945. *See* DOE Staff Report at 8. The report recognizes that retirements are happening, and states that “[w]hile stakeholders may maintain that a power plant has been forced to retire prematurely based on one or more of the considerations above, the results of this study show that some observed power plant retirements were appropriate and consistent with markets as they are currently functioning.” *Id.*; *see also id.* at 11 (“Markets recognize and compensate reliability, and must evolve to continue to compensate reliability, but more work is needed to address resilience.”). The retirement of generation before the end of its

useful life may be an appropriate market response if the costs associated with that plant are sufficiently higher than those of their competitors.

B. The DOE Staff Report Recommends Further Analysis of Resilience and Wholesale Market Changes, Not an Immediate Regulatory Intervention.

To the extent the DOE Staff Report identifies issues and challenges in the wholesale electric markets, it urges continued work on valuing reliability services but primarily recommends further review, analysis, and study of system resilience, and actions consistent with those assessments. For example:

- The DOE Staff Report finds that “[a] continual comprehensive regional and national review is needed to determine how a portfolio of domestic energy resources can be developed to ensure grid reliability and resilience.” DOE Staff Report at 14.
- “Where feasible and within its statutory authority, [the Commission] should study and make recommendations regarding efforts to require valuation of new and existing [essential reliability services] by creating fuel-neutral markets and/or regulatory mechanisms that compensate grid participants for services that are necessary to support reliable grid operations. *Pricing mechanisms or regulations should be fuel and technology neutral* and centered on the reliability services provided.” *Id.* at 126 (emphasis added).
- In looking forward, the DOE Staff Report suggests that “[r]esource portfolios could be complemented with wholesale market and product designs that recognize and complement resource diversity by compensating providers for the value of [essential reliability services] on a *technology-neutral* basis. *More work is needed* to define, quantify, and value resilience.” *Id.* at 100 (emphasis added).
- “*RTOs and ISOs* should further define criteria for resilience, identify how to include resilience in business practices, and examine resilience-related impacts of their resource mix.” *Id.* at 126 (emphasis added).

In those respects in which the DOE Staff Report recommends that policymakers act quickly, it suggests that those actions should be market-based, fuel-neutral, and consistent with the processes followed for successful RTO-driven reforms of recent years:

New market structures may be necessary to reflect [changing] market dynamics . . . RTO/ISOs are considering ways to better

support system resilience objectives in the same way that they explicitly recognized and administratively incorporated reliability standards into dispatch practices in the past. For example, the variety of problems that arose during the Polar Vortex . . . caused PJM and ISO-NE to change their capacity market rules to ensure generator performance during scarcity conditions. In summary, the debates surrounding wholesale markets are complex and multifaceted, but *the institutions and the grid itself have historically proven flexible, strong, and able to adapt*. Questions about revenue sufficiency and resilience must be addressed quickly, before the fast-moving evolution of our power system outpaces our ability to understand and manage it responsibly.

Id. at 118 (emphasis added); *see also id.* at 126 (Commission “should expedite its efforts with states, RTO/ISOs, and other stakeholders to improve energy price formation in centrally-organized wholesale electricity markets. After several years of fact finding and technical conferences, the record now supports energy price formation reform, such as the proposals laid out by PJM and others”).

While citing improvement in energy price formation, the DOE Staff Report does not recommend that RTOs provide full cost recovery for favored resources, as the Proposal would require. Only in the report’s final section, “Areas for Further Research,” does it intimate that cost-of-service treatment for certain resources is a potential option to promote system resilience. *Id.* at 129. The report suggests that the states—not the federal government—should “explore the costs and benefits” of such an approach. *Id.*

C. Other Studies Demonstrate that the Proposal’s Focus on “Baseload” Resources and Fuel Supply Is Flawed.

The Commission should look to independent analyses of the electric markets, which confirm that actual power sector conditions and experience show that the premises of the Proposal’s approach of rescuing uneconomic generation resources with federal intervention are mistaken. For example, in June 2017 the international economics consulting firm Analysis Group

published a report, *Electricity Markets, Reliability and the Evolving U.S. Power System* (“Analysis Group Report”),³² which rebutted the Proposal’s understanding that recent changes in the wholesale electric markets and resource retirements are imperiling electric system reliability:

The retirement of aging resources is a natural element of efficient and competitive market forces, and where markets are performing well, these retirements mainly represent the efficient exit of uncompetitive assets, resulting in long-run consumer benefits Although some commentators have raised concerns that the declining financial viability of certain conventional power plant technologies (like coal and nuclear power plants) that operate as merchant units in several wholesale electricity markets may be jeopardizing electric system reliability, there is no evidence supporting that conclusion.

Analysis Group Report at 4-5. The report also cited the promise of advanced energy technologies in serving future reliability needs:

Many advanced energy technologies can and do provide reliability benefits by increasing the diversity of the system. The addition of newer, more technologically advanced and more efficient natural gas and renewable technologies is rendering the power systems in this country more, rather than less, diverse. These newer generating resources are also contributing to the varied reliability services—such [as] frequency and voltage management, ramping and load-following capabilities, provision of contingency and replacement reserves, black start capability, and sufficient electricity output to meet demand at all times—that electric grids require to provide electric service to consumers on an around-the-clock basis. As a result, increasing quantities of natural gas and renewable generation are increasing the diversity of the power system and supporting continued reliable operations.

Id. at 5. In this regard, the Proposal also ignores DOE’s own analyses of the reliability benefits of adding renewable energy to the grid. For example, a recent study by the National Renewable

³² Paul Hibbard et al., *Electricity Markets, Reliability and the Evolving U.S. Power System*, Analysis Group (June 2017), available at http://www.analysisgroup.com/uploadedfiles/content/insights/publishing/ag_markets_reliability_final_june_2017.pdf.

Energy Laboratory (“NREL”) concluded that with high penetrations of wind and solar power, the Western grid can maintain reliability and stability during large grid disturbances; and, in fact, renewable energy can contribute to a more, not less, reliable power grid.³³ Other analyses similarly identify the capabilities of renewable resources and new technologies to support grid reliability and resilience, which the Proposal arbitrarily ignores.³⁴

Contrary to the Proposal’s misconceptions, fuel supply issues played essentially no role in recent customer outages. A recent analysis by the Rhodium Group analyzed DOE data on the causes of the 3.4 billion customer-hours of outages from 2012 to 2016. Of that time, only 2,382 hours, or 0.00007 percent of the total, was due to fuel supply problems. Of those, 2,333 hours

³³ National Renewable Energy Laboratory, *Western Grid Can Handle High Renewables in Challenging Conditions* (Fact Sheet) (Nov. 2015), available at <https://www.nrel.gov/docs/fy16osti/65302.pdf> and <https://www.nrel.gov/grid/wwsis.html>.

³⁴ The Brattle Group consultancy recently published a report reaching much the same conclusions. Judy Chang et al., *Advancing Past “Baseload” to a Flexible Grid*, Brattle Group, at iv (June 2017), available at http://www.brattle.com/system/publications/pdfs/000/005/456/original/Advancing_Past_Baseload_to_a_Flexible_Grid.pdf?1498482432 (“[G]iven the current trends of market fundamentals, public policy goals, and customer preferences, labeling any resources as “baseload” and compensating them on that basis alone does not help improve our electricity system’s reliability, efficiency, or effectiveness. System planners and operators have been and are continuing to improve mechanisms for mobilizing and compensating the flexibility services that are needed to maintain a cost-effective and reliable electricity system.”); *id.* at 13 (“Despite these significant retirements and the associated shift [in] resource mix, system operators have been able to meet the industry’s high and increasing reliability standards.”); *id.* at 23 (“The market designs for centralized wholesale markets in the U.S. are quite sophisticated and evolving to provide the necessary incentives to a broad range of resources that can contribute to system reliability.”); *id.* at 31 (“[T]echnologies, market fundamentals, policy priorities, and customer preferences are changing rapidly—all pointing to an increasingly broad range of different supply and demand resources; a more dynamic and versatile grid that can operationally integrate these resources and new technologies; and wholesale power markets that will increasingly reward both supply and demand resources for providing well-defined services and attributes such as energy, capacity, flexibility, and emissions reductions.”).

were due to fuel supply disruptions at a coal-fired power plant in northern Minnesota.³⁵ The most prevalent cause of outages is severe weather, with Hurricane Sandy accounting for nearly-one third of the total hours of power lost over that period. Puerto Rico's nearly complete power outage in the wake of Hurricane Maria has already accounted for nearly twice the total number of outage hours for 2016.³⁶

D. The Proposal Is Not Responsive to the Circumstances of the Polar Vortex or Recent Extreme Weather Events.

The Proposal says that its proposed tariffs are necessary to address electric reliability issues that are illustrated by the widespread cold-weather event during the winter of 2014 known as the Polar Vortex, as well as other extreme weather events. The Proposal further suggests it should be finalized in time to protect against cold-weather events this coming winter. *See* Proposal at 46,945.³⁷ The Proposal's account of electric system challenges during those events is deeply flawed, and the circumstances of those events do not support the Proposal.

With regard to the Polar Vortex, large swaths of the eastern and southern parts of the United States faced sustained and record-setting cold weather during that period. According to NERC's post-mortem analysis, less than 0.1 percent of customer load was disrupted in the

³⁵ Trevor Houser et al., *The Real Electricity Reliability Crisis*, Rhodium Group (Oct. 3, 2017), at <http://rhg.com/notes/the-real-electricity-reliability-crisis>.

³⁶ *Id.*

³⁷ Commission staff's recent report on energy market conditions during the upcoming winter utterly contradicts the supposed urgency of implementing the Proposal, concluding that "[a]ll regions are expected to maintain healthy reserve margins for the winter," "[s]taff analysis identifies few major concerns," "[t]he markets appear to be prepared to manage disruptive events" and "at this time we do not see major risk factors that would likely lead to significant market disruptions during this winter." Winter Energy Market Assessment at 13, 19.

affected areas, and system operators “successfully maintained reliability. . . .”³⁸ In fact, the affected load was in South Carolina Electric and Gas service territory, which is not part of an organized wholesale market, and the outages were caused by frozen equipment at generators, *not* by fuel supply issues.³⁹ While much of the commentary regarding the Polar Vortex has focused on curtailment of natural gas supplies for electric generation, according to NERC, fuel supply issues accounted for less than half of the generator outages associated with the Polar Vortex. Instead, the majority were associated with the direct effects of cold weather on generation and transmission equipment. *Id.* at 4-5. For example, at the height of the cold weather, PJM reported that more than 15,000 MW of its coal and nuclear resources were offline.⁴⁰ In short, fuel supply was only one of several causes of electric system stress during the Polar Vortex,⁴¹ and there is no evidence that a system with fewer coal and nuclear resources would fare worse in the future,

³⁸ See NERC, *Polar Vortex Review* at iii (2014), at http://www.nerc.com/pa/rrm/January%202014%20Polar%20Vortex%20Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf.

⁴⁰ PJM Interconnection, *Analysis of Operational Events and Market Impacts During the January 2014 Cold Weather Events* at 26 (May 8, 2014), available at <http://www.pjm.com/~media/library/reports-notice/weather-related/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx>. See also *id.* at 4 (“Equipment issues associated with both coal and natural gas units caused the greatest proportion of forced outages. Natural gas interruptions comprised approximately 25 percent of the total outages.”); *id.* at 24 (“All conventional forms of generation, including natural gas, coal and nuclear plants, were challenged by the extreme conditions.”). See also MISO, *2013-2014 MISO Cold Weather Operations Report* at 25 (Nov. 2014), available at <https://www.misoenergy.org/Library/Repository/Report/Seasonal%20Market%20Assessments/2013-2014%20Cold%20Weather%20Operations%20Report.pdf> (“[G]enerating units of all fuel types in MISO’s footprint were affected by weather-related forced outages during the January 2014 polar vortex.”).

⁴¹ Nor are fuel supply issues unique to natural gas facilities. See MISO, *supra* note 40, at 13 (noting that “at least one power plant in MISO’s footprint that has coal delivered to it via barge experienced problems due to iced-over rivers and lakes”).

especially given the many market reforms that have occurred since the Polar Vortex. Just as importantly, resources other than coal and nuclear played a significant role in maintaining system reliability, including energy efficiency, demand response, and renewables.⁴²

All generation sources face challenges from extreme weather.⁴³ Even with on-site fuel supplies, the Proposal's favored resources do not always have the ability to run in challenging weather events, based on recent experience. For instance, in Texas, following Hurricane Harvey's torrential flooding, the external coal pile at the 2,500 MW W.A. Parish coal power plant was "so saturated with rainwater that coal was unable to be delivered into the silos from the conveyer system," and two units at the facility were switched to natural gas.⁴⁴ In Florida, as Hurricane Irma approached in September, one of the state's two nuclear power plants shut down, and the other ran at reduced capacity.⁴⁵ These anecdotes demonstrate that the Proposal's

⁴² See, e.g., Susan Tierney et al., *Electric System Reliability and the EPA's Clean Power Plan: The Case of PJM*, Analysis Group, at 12-13 (Mar. 2015), available at http://www.analysisgroup.com/uploadedfiles/content/insights/publishing/electric_system_reliability_and_epas_clean_power_plan_case_of_pjm.pdf (PJM utilized demand response and wind generation to meet demand, despite substantial loss of coal, nuclear, and natural gas capacity); Greg Hresko et al., *Wind Energy Saves Consumers Money During the Polar Vortex*, American Wind Energy Association, at 1 (Jan. 2015), available at <http://awea.files.cms-plus.com/AWEA%20Cold%20Snap%20Report%20Final%20-%20January%202015.pdf> ("[W]ind energy provided large quantities of critical electricity supply when it was needed most, keeping the lights on and reducing the impact of these price spikes").

⁴³ A profound irony of the Proposal is that it seeks to prolong operations at coal-fired power plants and also their substantial greenhouse gas emissions, which are worsening the risks of extreme weather events that are driven or exacerbated by climate change. The Proposal does not mention or acknowledge that its approach could increase greenhouse gas emissions. See Section VI.C, *infra*.

⁴⁴ See Mark Watson, *Harvey's Rain Caused Coal-to-Gas Switching*, Platts (Sept. 27, 2017), at <https://www.platts.com/latest-news/electric-power/houston/harveys-rain-caused-coal-to-gas-switching-nrg-21081527>.

⁴⁵ See *Hurricane Irma Caused Power Outages for Two out of Three Florida Customers*, Electric Light & Power (Sept. 20, 2017), at <http://www.elp.com/articles/2017/09/hurricane-irma-caused-power-outages-for-two-out-of-three-florida-customers.html> ("Hurricane Irma also affected Florida's two nuclear power plants, which are among the largest power plants in the state. Both

assumptions about the resilience of the favored resources are false, and that the resilience values of other resources warrant greater consideration.⁴⁶

V. The States' Experiences with Clean Energy Development and the Retirement of Aging, Uneconomic Generation Demonstrates There is No Pressing Reliability or Resilience Crisis Warranting Extraordinary Federal Intervention.

The Proposal's alarm regarding the growth of renewable resources (*see, e.g.*, Proposal at 46,943) is at odds with our States' success in integrating clean energy sources into the electric sector. For example:

- **California** has made rapid advances towards integration of renewable supply-side technologies and demand-side programs while simultaneously managing the retirement of baseload plants. Since 2003, procurement by California's large investor owned utilities⁴⁷ has resulted in 15,565 MW of installed renewable capacity under the Renewables Portfolio Standard ("RPS") program.⁴⁸ The average RPS portfolio for these utilities, which serve about 68% of California's electrical load, grew from 13.25% in 2003 to 32% in 2016.⁴⁹ On May 16, 2017, over 40% of California ISO ("CAISO") load was served with renewables (not including large hydro or behind-the-meter solar PV), and during peak renewables

reactors at the Turkey Point nuclear power plant in south Florida were shut down as a precaution before the storm arrived. The St. Lucie nuclear power plant remained operating, although at reduced levels.").

⁴⁶ See Amory B. Lovins, *Does 'Fuel on Hand' Make Coal and Nuclear Power Plants More Valuable?*, Forbes (May 1, 2017), at <https://www.forbes.com/sites/amorylovins/2017/05/01/does-fuel-on-hand-make-coal-and-nuclear-power-plants-more-valuable/#4a0d9d5c69023>.

Comm'n, Proceeding No. R.15-02-020, available at https://apps.cpuc.ca.gov/apex/f?p=401:56:0::NO:RP,57,RIR:P5_PROCEEDING_SELECT:R1502020 (containing investor-owned utilities' RPS compliance filings).

production that day, renewables supplied nearly 72% of CAISO's electricity.⁵⁰ Renewable technologies contributed significantly to meeting CAISO system load during a record breaking heat wave on September 1, 2017, with the vast majority of that contribution coming from solar photovoltaic installations.⁵¹

- In **Connecticut**, the state has implemented policies that have directly procured commitments of renewable energy generation and energy efficiency that equal the generation of a large power plant, at competitive pricing. Specifically, in 2016 alone, the state procured over 400 MW of state-solicited small scale renewable energy and energy efficiency resources, 170 MW of which will be located in Connecticut, and close to 400 MW of large-scale renewable energy projects split between Connecticut, Massachusetts, and Rhode Island. The price of these selected grid-scale bids dropped by nearly half compared to procurements in 2012 and 2013. Using its procurement authority thus far, Connecticut has solicited long-term contracts with clean energy resources to meet over 5% of its electric load. Connecticut has authority remaining to contract an additional approximate 17% of load with clean energy resources.⁵² These procurements have expressly focused on renewable resources that provide generation during peak load times, directly strengthening grid reliability and resilience.⁵³
- In **Illinois**, there is currently more than 4,000 MW of wind power installed, growing from just 50 MW in 2003.⁵⁴ Illinois wind farms produced 612,000 megawatt hours ("MWh") of electricity in July 2017, up 52% from the prior

⁵⁰ CAISO, *Renewables Watch for Operating Day May 16, 2017*, at http://content.caiso.com/green/renewrpt/20170516_DailyRenewablesWatch.pdf; Gavin Bade, *CAISO: Renewables Served 42% of California Demand on May 16, Setting Record*, Utility Dive (May 18, 2017), at <http://www.utilitydive.com/news/caiso-renewables-served-42-of-california-demand-on-may-16-setting-record/442926/>. Note that the RPS program measures compliance in MWh, whereas CAISO data measure load percentages in MW.

year.⁵⁵ Over the last year, nuclear power remained essentially constant, and coal based generation decreased 8.8%, while still providing 6,417,000 MWh of energy in 2017.⁵⁶

- **In Maryland**, approximately 1,458 MW of generation capacity comes from renewable resources.⁵⁷ Maryland customers currently have access to over 750 MW of installed solar power, with 276.9 MW of installed solar energy having been added in 2016 alone.⁵⁸ Marylanders also have access to over 250 MW of installed wind power, and the state has taken significant steps toward the development of its offshore wind resources. In May 2017, the Maryland Public Service Commission awarded offshore wind renewable energy credits to two projects, which will pave the way for the construction of 368 MW of capacity off the coast of Maryland.
- **Massachusetts** renewable and clean energy projects have added or are in the process of adding a total of approximately 26,000,000 MWh of annual electricity for Massachusetts customers (expected to be over 50% of Massachusetts's annual electric load) under either statutory or regulatory mandates pursuant to the Green Communities Act, St. 2008, c. 169, §§ 83, 83A, 83C, and 83D, and the Renewable Portfolio Standards, Mass. Gen. Laws ch. 25A, § 11F.⁵⁹
- **Oregon** is the eighth-ranked state in the nation for installed wind capacity, with 3,213 MW in operation.⁶⁰ A total of forty-four projects span the state, with the first project installed in 1998. Individual utility-scale wind projects range from 10

⁵⁸ See Solar Energy Industries Association, *Solar State by State*, at <https://www.seia.org/state-solar-policy/maryland-solar> (last visited Oct. 21, 2017).

⁵⁹ These projects include onshore and offshore wind, hydropower, and solar. Some of these projects are already in operation, some are under contract and awaiting regulatory approval prior to construction, some are constructed and waiting for interconnection, and others are in the bidding stage.

⁶⁰ American Wind Energy Association, *Oregon Wind Facts*, at <https://www.awea.org/resources/statefactsheets.aspx> (last visited Oct. 21, 2017).

MW to nearly 900 MW.⁶¹ As of mid-2017, the wind projects in Oregon powered the equivalent of over 660,000 homes.

- **Vermont** has over 200 MW of installed solar (about 5% of sales and 20% of peak load) and over 100 MW of installed wind (about 6% of sales), not to mention 200 MW of hydropower and approximately 100 MW of biopower (biomass and farm and landfill methane). The State's electric utilities are on course to meet their 55% renewable electricity by 2017 targets, and are required to meet 75% of sales with renewable electricity by 2032. *See* 30 Vt. Stat. Ann. § 8005(a)(1)(B). All utility and merchant generation in Vermont is subject to state siting regulation and must adhere to a number of criteria, including need, least-cost principles (for utility-owned generation, this entails an examination of whether the investment is the least-cost solution to demand when compared with energy conservation, efficiency, and load management), and maintenance of system stability and reliability. *See, e.g.,* 30 Vt. Stat. Ann. § 248(b). The State gradually lifted its net metering cap from 2% to 4% to 15% of load as no adverse negative impacts to system stability were observed, and now there is no set cap. *See* 30 Vt. Stat. Ann. § 8010 (Self-Generation and Net-Metering); Vt. Admin. Code 18-1-17:5.100 (Construction and Operation of Net Metering Systems).
- **Washington** is one of the top ten states in the nation for installed wind capacity, having successfully integrated over 3,000 MW of wind power since 2001.⁶² In 2016 alone, the energy produced from wind in Washington powered the equivalent of almost 750,000 homes.⁶³

In addition, many states and regional markets have successfully managed the retirement of coal and other uneconomic resources and are pursuing innovations that will benefit system reliability and resilience, including market-based compensation for demand response and investments in energy efficiency, energy storage, and other technologies. For example:

- As the DOE Staff Report noted with respect to energy storage, “**California** has directed its utilities to acquire 500 MW of energy storage by 2020; **Massachusetts** [has set a target for electric companies] to procure 200 MWh of energy storage by the end of 2019; **New York**’s legislators have proposed

⁶¹ Renewable Northwest Project, Renewable Energy Projects, *at* http://www.rnp.org/project_map?field_project_state_value%5B%5D=OR&tid%5B%5D=7&field_project_opstatus_value%5B%5D=Operating (last visited Oct. 21, 2017).

⁶³ American Wind Energy Association, Washington Wind Facts, *at* <https://www.awea.org/resources/statefactsheets.aspx> (last visited Oct. 21, 2017).

creation of an Energy Storage Deployment Program, with a 2030 procurement target; **Maryland** has adopted at 30 percent investment tax credit for storage facilities; and **Nevada**'s legislature has passed a storage incentivize. These programs are generally technology-neutral and will support the use of storage at the grid-level or behind the meter (on the customer's premises)." DOE Staff Report at 74.

- **California**, through its Public Utilities Commission, has authorized a competitive procurement mechanism for demand response resources, known as the Demand Response Auction Mechanism ("DRAM") pilot. The objective of the DRAM is to ensure competitively priced, cost-effective and reliable demand response resources for the state. Demand response resources procured through the DRAM are required to bid their capacity into CAISO energy markets for market award dispatches, with approximately 184 MWs under contract for delivery in 2018. In addition, California has prioritized development of energy storage through a 1.325 gigawatt procurement mandate, reliability standards, creation of wholesale market products and rules with the Distributed Energy Resource Provider and Non-Generator Resource models, and approving storage contracts to meet local reliability needs and partially replace the San Onofre nuclear generating station. California regulators developed a roadmap to consider and eliminate unnecessary regulatory barriers to storage market participation and are in the process of developing rules by which a storage resource can serve multiple reliability functions.⁶⁴
- **Connecticut** has developed a first-in-the-nation statewide microgrid program to build local resiliency for electrical load in critical community operations. This program implementation now includes five operational microgrids and five in development.⁶⁵ Through its conservation and load management program, Connecticut invests approximately \$246 million annually in statewide energy efficiency programs that has saved residents and businesses 1.29 billion kWh of electricity, 19.6 million ccf of gas, and 976 thousand tons of carbon dioxide.⁶⁶ In addition, through its 2016 solicitations for clean energy resources, Connecticut solicited through a competitive process an additional 34 MW of energy efficiency at a competitive price.⁶⁷

⁶⁴ California Energy Commission, California Public Utilities Commission & CAISO, *Advancing and Maximizing the Value of Energy Storage Technology – A California Roadmap* (Dec. 2014), available at https://www.caiso.com/Documents/Advancing-MaximizingValueofEnergyStorageTechnology_CaliforniaRoadmap.pdf.

⁶⁵ See Connecticut Department of Energy & Environmental Protection, *supra* note 52.

⁶⁶ Connecticut Department of Energy & Environmental Protection, *Energy Efficiency*, available at <http://www.ct.gov/deep/cwp/view.asp?a=4405&Q=513716>.

⁶⁷ *Id.*

- **Maryland** is encouraging energy efficiency through the State's EmPOWER program, which was first enacted in 2008. *See* EmPOWER Maryland Energy Efficiency Act of 2008, H.B. 374, 2008 Gen. Assemb., Reg. Sess. (Md. 2008). Implementation of the EmPOWER program led to a 15% reduction in demand based on a 2007 baseline. During the 2017 legislative session, the Maryland General Assembly extended the EmPOWER program through 2023. *See* H.B. 514, 2017 Gen. Assemb., Reg. Sess. (Md. 2017). In addition, Maryland has started to explore energy storage using grid-connected battery systems as an important tool that will facilitate the integration of renewable energy, bolster grid reliability, and provide for flexibility in the grid. In 2017, the Maryland General Assembly adopted measures both to encourage the installation of energy storage through a dedicated tax credit⁶⁸ and to study methods to promote the deployment of energy storage on all parts of the electricity grid.⁶⁹ *See* S.B. 758, 2017 Gen. Assemb., Reg. Sess. (Md. 2017) (tax credit); H.B. 773, 2017 Gen. Assemb., Reg. Sess. (Md. 2017) (methods study). The Maryland Public Service Commission is also considering how energy storage may advance the goal of transforming state's distribution system.⁷⁰
- In **Massachusetts**, 1,662 MW of coal generation capacity has been retired since 2008, leaving no coal fired power plants in the state. At the same time, Massachusetts has invested heavily in developing a robust clean energy industry, as detailed *infra*, and has become a national leader in energy efficiency. Further, it is actively exploring storage technologies, and the Department of Energy Resources issued a report last fall with the goal of spurring investment in 600 MW of grid-scale energy storage in Massachusetts by 2025.⁷¹
- Spurred by the 1988 bankruptcy of its largest utility as triggered by cost overruns and construction delays at the Seabrook nuclear power plant, **New Hampshire** was among the first states to opt for restructuring, *see* N.H. Laws 1996, ch. 129,

⁶⁸ Maryland's new tax credit provides for up to \$5,000.00 for a system installed on a residential property and the lesser of \$75,000 or 30% of the cost of installation of a system installed on a commercial property.

⁶⁹ The law requires that Maryland's Power Plant Research Program conduct a study—in collaboration with other state stakeholders—and submit a report by December 1, 2018, as to the regulatory reforms and market incentives necessary or beneficial to increase the use of energy storage devices in the state.

⁷⁰ *See* Maryland Public Service Commission, *In The Matter of Transforming Maryland's Electric Distribution Systems to Ensure that Electric Service is Customer-Centered, Affordable, Reliable and Environmentally Sustainable in Maryland*, PC44, Notice of Public Conference, at 3 (Sept. 26, 2016).

⁷¹ Massachusetts Department of Energy Resources, *State of Charge: Massachusetts Energy Storage Initiative Study* (Sept. 16, 2016), available at <https://www.mass.gov/files/2017-07/state-of-charge-report.pdf>.

but lawmakers then paused the process as to the utility's non-nuclear generation portfolio, including two coal-fired plants—Merrimack and Schiller Stations—because relying on these facilities was cheaper for end-users than purchasing power at wholesale. But technological and market realities evolved and, in 2015, the New Hampshire Legislature authorized the completion of the restructuring process, provided that the Public Utilities Commission made a “public interest” finding that considered general economic and specific ratepayer impacts. *See* N.H. Laws 2015, ch. 221:10, codified as N.H. RSA 369-B:3-a. On October 12, 2017, the utility filed the results of the asset divestiture auction.⁷² If approved, the proposed sale of Merrimack and Schiller stations would result in some \$600 million in stranded cost recovery for the utility, in exchange for which ratepayers would no longer be required to subsidize the operation of coal plants whose dispatch pattern in recent years has reduced them to occasionally used resources.

- The only operating coal plant in **Oregon** is in Boardman and is scheduled for closure in 2020. The plant owner, Portland General Electric, is testing the potential to convert the plant into a renewable energy generation facility using biomass for fuel.⁷³ Oregon investor-owned electric utilities are exploring energy storage because the passage of HB 2193 (2015) mandates energy storage be installed at each utility by 2020. Through a collaborative stakeholder process at the Oregon Public Utilities Commission (Docket UM 17510), the utilities are focusing on many potential benefits of energy storage, including increasing transmission and distribution reliability and increasing energy system resiliency.⁷⁴
- The capacity of **Vermont's** solar installations alone is equivalent to one-fifth of the state's peak load, and every new proposed project is required to meet interconnection standards to ensure it does not adversely affect system stability and reliability. While solar has shifted Vermont's peak from mid-day to evening, the state's peak has declined due to the state's aggressive pursuit of conservation and energy efficiency, and utilities are adjusting to changes in load shape using traditional tools such as rate design, load shifting, and demand response as well as emerging tools such as real-time weather forecasting and advanced energy storage. Vermont currently has a large utility-owned battery storage project that

⁷² J.P Morgan Securities, LLC, *Public Service Company of New Hampshire d/b/a Eversource Energy Sale of Generating Facilities: Report of the Auction Advisor*, N.H. Pub. Utils. reduces utility peaks, integrates solar, and can enhance grid reliability by islanding a distribution circuit hosting the local emergency shelter in the event of a wider grid outage. That same utility is pursuing other solar-plus-storage projects and is also embarking on a pilot to deploy up to 10 MW of residential storage systems to provide grid services in the aggregate and reliability to individual customers.

VI. The Proposal Poses a Serious Threat of Harm to the States and Excessive Costs for Ratepayers.

The State Commenters are deeply concerned that, in its current form, the Proposal would cause significant harm to our States by compelling ratepayers to subsidize costly power generation resources without demonstrated need or benefit, undermining State energy laws and policies, and by putting public health and the environment at greater risk.

A. A Federal Mandate to Subsidize the “Fuel-Secure” Resources Will Significantly and Unnecessarily Raise Energy Costs for Consumers.

There is no question that the Proposal will burden ratepayers with additional costs and risks. Indeed, the Proposal makes no attempt to argue otherwise.⁷⁵ Rather, the whole point of the Proposal is to charge customers more money and to give that money to uneconomic generation resources so they do not retire. One early analysis estimates potential added customer costs in the billions of dollars per year.⁷⁶ Yet, the Proposal provides no assessment of, or justification for,

⁷⁵ As noted in Sections I, II.A, and II.B, *supra*, the Proposal provides no analysis regarding the customer costs. The absence of a cost analysis is cause enough for the Commission to reject it.

⁷⁶ See Robbie Orvis et al., *The Department of Energy’s Grid Resilience Pricing Proposal: A Cost Analysis*, Energy Innovation (Oct. 2017), available at http://energyinnovation.org/wp-content/uploads/2017/10/20171021_Resilience-NOPR-Cost-Research-Note-FINAL.pdf (annual cost to customers conservatively estimated at \$2.4 -10.6 billion); ICF International, Inc., *DOE Acts to Transform the Energy Landscape*, at 27 [Webinar] (Oct. 4, 2017), available at <https://www.icf.com/resources/webinars/2017/doe-nopr> (cost could reach \$3.8 billion per year); see also Jeff St. John, *FERC Commissioners and Staff Question DOE’s Push for Cost Recovery for Coal and Nuclear*, Greentech Media (Oct. 10, 2017), at <https://www.greentechmedia.com/articles/read/ferc-commissioners-and-staff-question-does-push-for-cost-recovery-for-coal#gs.lnQFaSg>.

those costs or the value of what customers will get in return. Indeed, no one has provided customers or their state representatives with any cost information nor consulted with them about whether they think a federal mandate to spend extra money to prevent the retirement of these uneconomic facilities is reasonable. Moreover, unlike other types of targeted incentives that the federal government and states provide under specific laws to advance public policies, customers will pay all of the direct costs associated with full cost recovery for the preferred, otherwise non-competitive generation, and will also bear all the monetary risks associated with the operation, maintenance, and capital of the subsidized generation. This burden on customers is precisely what the wholesale markets are designed to avoid. The Proposal would result in an extraordinary transfer of wealth from customers to generation owners with only undefined and unquantified customer benefits, if any, but certain adverse environmental and public health effects.⁷⁷

B. The Proposal Undermines State Energy Laws and Policies.

Of great concern to the State Commenters are the implications of the Proposal for our respective state laws and policies regarding energy, including State restructuring statutes and renewable energy and climate goals. Overall, it is clear that the Proposal directly subsidizes generation resources in a manner that intrudes on states' role as overseers of "the economic aspects of electrical generation," *Pacific Gas & Elec. Co. v. State Energy Res. Conservation & Dev. Comm'n*, 461 U.S. 190, 206 (1983); *see also* Federal Power Act, § 201(b)(1), 16 U.S.C. § 824(b)(1) (Commission lacks general jurisdiction over "facilities used for the generation of

⁷⁷ In this sense, the Proposal is quite different from recently-established state zero-emission-credit programs that provide additional incentives to nuclear generation under state law authorities. These programs tie resource compensation to certain measurable environmental attributes that benefit air quality, public health, and the states' achievement of greenhouse gas emission reduction goals. *See, e.g.,* Illinois Power Agency Act, § 1-75(d-5), 20 ILCS 3855/1-5 *et seq.* (2016).

electric energy”). In this regard, the Proposal effectively overrides the choices made by the states with restructured electric markets to allow those markets, along with other policy decisions by states to promote alternative energy sources and to secure reductions in power sector emissions, to guide capacity additions and retirements, and the choices made by states with traditional cost-of-service regulation to retire facilities in the best interest of ratepayers.⁷⁸ For example:⁷⁹

Regional Greenhouse Gas Initiative

- First implemented in 2009, the Regional Greenhouse Gas Initiative (“RGGI”) is a mandatory market-based program of nine states in the Northeast and Mid-Atlantic that seeks to reduce power sector greenhouse gas (“GHG”) emissions.⁸⁰ The RGGI states have established a regional cap on carbon dioxide (“CO₂”) emissions from electric generators and require power plants to possess a tradable CO₂ allowance for each ton of CO₂ they emit.⁸¹ The emissions cap is set at 84.3 million short tons in 2017, and declines 2.5 percent each year until 2020 to about 78.2 million tons. The RGGI states are working diligently to meet their commitments, and in August 2017, announced a further CO₂ reduction to 55.7 million tons by 2030. This represents a 65 percent drop from regional CO₂ levels in 2009.⁸² By subsidizing coal generation sources, the Proposal would directly impede the achievement of the RGGI states’ emissions reduction goals.

California

- California is implementing numerous statutory mandates to support greenhouse gas reductions and mitigate climate change. Significant recent examples include the following:

⁷⁸ This intrusion into state prerogatives is in conflict with the Commission’s recent decisions, including Order No. 1000, which mandates regional transmission planning to *accommodate* state energy policies. See Order No. 1000, Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities, 76 Fed. Reg. 49,842 (Aug. 11, 2011).

⁷⁹ For additional information, see the comments filed by certain State Commenters’ respective state utilities regulators in this docket.

⁸⁰ The nine states are: Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont.

⁸¹ Regional Greenhouse Gas Initiative, Inc., *About the Regional Greenhouse Gas Initiative Fact Sheet* (June 2017), available at https://www.rggi.org/docs/Documents/RGGI_Fact_Sheet.pdf.

⁸² Alex Guillen, *RGGI States Plan Further 30 Percent Emissions Cut by 2030*, Politico (Aug. 23, 2017), at <http://www.politico.com/states/new-york/albany/whiteboard/2017/08/23/rggi-states-proposed-further-30-percent-emissions-cuts-by-2030-8613376>.

- SB 350 (De Leon),⁸³ which requires the state to establish GHG reduction planning targets through integrated resource planning for the electricity sector and increases the state's RPS to 50 percent by 2030.
- SB 32 (Pavley),⁸⁴ which codified an emissions reduction target of 40 percent below 1990 levels by 2030.
- SB 1383 (Lara),⁸⁵ which requires the development of a Short-Lived Climate Pollutant Strategy and sets forth specific 2030 targets:
 - 40 percent reduction in methane from 2013 levels;
 - 40 percent reduction in hydrofluorocarbon gases from 2013 levels; and
 - 50 percent reduction in anthropogenic black carbon.
- California has significantly reduced its coal capacity and as a result has seen significant greenhouse gas emissions reductions over the past decade.⁸⁶ The Proposal encourages an increased procurement of coal resources, which conflicts with California's energy goals and the direction the state has taken on maintaining a low-carbon grid.

Connecticut

- Connecticut introduced restructuring in 1998 in order to gain access to energy markets to benefit ratepayers.⁸⁷ Removing a significant part of the region's generation from competitive markets would frustrate that purpose and could prolong the life of coal-fired plants that would threaten timely achievement of Connecticut's Global Warming Solutions Act goals. The state's most recent inventory shows that the State has reduced greenhouse gas emissions 4 percent below 1990 levels and 14 percent below 2001 levels. Connecticut's statutory goal is to reduce emissions to 10% below 1990 levels by 2020 and 80% below 2001 levels by 2050. Conn. Gen. Stat. § 22a.200c.

⁸⁷ See Connecticut Department of Energy and Environmental Protection, *supra* note 52.

Illinois

- In Illinois, the Electric Service Customer Choice and Rate Relief Act of 1997, 220 ILCS 5/16-101A, ushered in a transition to a competitive market for electric generation with the goal of employing competitive forces to “create new opportunities for new products and services for customers and lower costs for users of electricity.” Illinois law maintains the core statutory goals of ensuring the provision of “safe, reliable, and affordable service” by relying on market forces to keep prices just and reasonable. The law in Illinois is based on “the competitiveness of supply and [] price-responsiveness of the demand for service.” 220 ILCS 5/16-101A(f).
- The Illinois Energy Efficiency Portfolio Standard requires the state’s largest utilities to invest in energy efficiency and demand response measures, which help customers save energy and reduce usage during periods of high demand on the grid. Illinois’s largest utility, Commonwealth Edison Company (“ComEd”), which serves Chicago and a large part of Northern Illinois, recently reported that energy efficiency efforts have helped save customers 21.5 million MWh of energy—enough to power more than 2.3 million homes for a year—and has created customer savings of \$2.3 billion on electric bills. State legislation enacted in 2016 directed an expansion of energy efficiency programs in Illinois. For example, under the law, ComEd now has a goal of increasing efficiency programs to ultimately produce a 21.5 percent reduction in energy use by 2030. These efficiency efforts in Illinois reduce demands on the system, thereby increasing reliability and resiliency and obviating the need for expensive policies such as those Proposal.
- Since the restructuring of Illinois’s electricity laws, the risks and rewards associated with generation have been managed by generation owners. For example, NRG acquired six coal plants in Illinois through its subsidiary Midwest Generation, and repowered one of them to natural gas, keeping it operating.⁸⁸ It also closed two urban coal plants, reducing air pollution in city neighborhoods with no effect on resource adequacy.⁸⁹ Dynegy currently owns twelve fossil fuel plants: eight are coal, three are natural gas and one is coal and gas.⁹⁰ Dynegy has

⁸⁸ *Illinois coal plant to close a unit in clean-air move*, Crain’s Chicago Business (Aug. 7, 2014), available at <http://www.chicagobusiness.com/article/20140807/NEWS11/140809839/illinois-coal-plant-to-close-a-unit-in-clean-air-move>.

⁸⁹ Julie Wernau, *Redevelopment ahead for Chicago’s two coal plant sites*, Chicago Tribune (Dec. 1, 2014), available at <http://www.chicagotribune.com/business/ct-crawford-fisk-sites-1130-biz-20141126-story.html>.

⁹⁰ Dynegy Inc., *Dynegy in Illinois* (Feb. 2017), available at <https://www.dynegy.com/sites/default/files/dynegy-factsheet-Illinois.pdf>.

closed or suspended operations of five other units in Illinois.⁹¹ Despite these closings, Dynegy has sufficient capacity to meet as much as 95% of the MISO Zone 4 local clearing requirement (5,561 MW vs. 5,836 MW in the latest capacity auction).⁹²

- Prolonging the life of coal-fired power plants that are facing market signals to retire may make it more difficult or expensive to achieve the Illinois Renewable Portfolio Standard, which requires that 25% of the state's energy come from resources like wind and solar by 2025. Pursuant to state legislation enacted in 2016, the Illinois Power Agency is currently procuring one million renewable energy credits from new utility-scale wind and solar projects, which will provide energy at lower cost than energy from uneconomic coal plants.

Maryland

- In Maryland, the Electric Utility Industry Restructuring of 1999 required a transition to a competitive market for electric generation with the stated goals of, *inter alia*, establishing customer choice, providing economic benefits for all customer classes, and ensuring compliance with federal and state environmental standards. *See* S.B. 300, 1999 Gen. Assemb., Reg. Sess. (Md. 1999). Prolonging the life of coal-fired power plants in Maryland that might otherwise be close to retirement would threaten the progress achieved through RGGI, which Maryland is required to be a part of pursuant to Maryland's Healthy Air Act, Environ. Art. §§ 2-1001 through 2-1005. Through Maryland's participation in RGGI, Maryland has made a commitment to the use of renewable energy and achieving the State's climate goals. Maryland also has a robust renewable portfolio standard ("RPS"), which was created by law in 2004. It is a two-tiered system with carve-outs for solar energy and offshore wind energy, and corresponding renewable energy credits ("RECs") for each tier. Electric utilities and other electricity suppliers must submit RECs equal to a percentage specified in statute each year or else pay an alternative compliance payment ("ACP") equivalent to their shortfall. Over the past few years, the requirements have been met almost entirely through RECs, with negligible reliance on ACPs. In 2016, Maryland increased its RPS, requiring utilities to derive 25 percent of their energy from renewable resources by 2020. *See* H.B. 1106, 2016 Gen. Assemb., Reg. Sess. (Md. 2016).

⁹¹ Jacob Barker, *Why is Dynegy idling Illinois coal plants? It's more complicated than 'the war on coal'*, St. Louis Post-Dispatch, (May 28, 2016), available at http://www.stltoday.com/business/local/why-is-dynegy-idling-illinois-coal-plants-it-s-more/article_7a1bd217-a83d-579b-93a8-d17b86de27c4.html.

⁹² MISO, *supra* note 25, at 9.

Massachusetts

- In 1997, the Massachusetts Legislature enacted the Electric Industry Restructuring Act to restructure its electric utility industry. *See* Mass. St. 1997, ch. 164. The general purpose of the Restructuring Act was to take electric utilities out of the generation portion of the electricity business. *See* Mass. Gen. Laws ch. 164, §1A(b)(2) (referencing the electric companies' "requirement to divest generation facilities"). The Massachusetts Department of Public Utilities ("Department") has held that its limited role over the generation component of electricity service following the Restructuring Act "represents a clear policy choice that electric generation resources are best developed in response to price signals from a competitive marketplace." *Investigation by the Dep't of Pub. Utils.*, Mass. D.P.U. 12-77, at 28 (2013). More importantly, by moving electricity generation outside of the Department's jurisdiction and into the competitive marketplace, the Department found that the Restructuring Act "shifted the risks of generation development from consumers to generators, who are better positioned to manage those risks." *Id.* This shift in risk allowed consumers to benefit from lower prices for electricity while also enjoying protection from the "construction, operational, and prices risks that were inherent in commodity rate regulation." *Id.* Clearly, if the Commission were to impose on Massachusetts ratepayers a "cost-of-service" regime to support coal and nuclear generating resources, it would directly interfere with and contradict the Massachusetts legislature's intent to shield ratepayers from the operational risks and investment decisions of all generating resources.
- Further, Massachusetts's major investments in renewables and energy efficiency are deliberate efforts to create a clean energy industry and to address the risks of climate change. The Proposal is directly at odds with the energy policy chosen by Massachusetts. Massachusetts has adopted a broad portfolio of laws and regulations to reduce economy-wide greenhouse gas emissions by 25 percent by 2020 and 80 percent by 2050 from 1990 levels, including the Global Warming Solutions Act (2008), the Green Communities Act (2008), the Act to Promote Energy Diversity (2016), RGGI, and programs to promote low and zero-emission vehicles, among others. The clean energy industry is a powerful and growing economic engine for Massachusetts. The state has seen consistent growth across all aspects of the clean energy sector, from energy efficiency to alternative transportation, to renewable energy development. Clean energy contributes \$11.8 billion to the Massachusetts economy— a 2.5 percent share of the gross state product—and its employees account for 2.9 percent of the state's labor market. Since 2010, the number of clean energy jobs has increased dramatically — 45,000 new clean energy jobs have been added, a 75 percent increase.⁹³ This success has

⁹³ Massachusetts Clean Energy Center, *2016 Massachusetts Clean Energy Industry Report*, at 3-4, 8 (Dec. 2016), *available at* [http://files.masscec.com/2016%20MassCEC CE Report Complete%20%281%29-2.pdf](http://files.masscec.com/2016%20MassCEC%20CE%20Report%20Complete%20%281%29-2.pdf).

shown that states can grow their economies through investing in clean energy and reducing greenhouse gas emissions. The Proposal's attempt to force Massachusetts to subsidize nuclear and fossil fuel generating resources in contravention of its carefully developed renewable energy and climate policies is overreaching and inappropriate.

New Hampshire

- When New Hampshire became one of the first states to embrace wholesale and retail competition in the electric industry in 1996, it did so “to develop a more efficient industry structure and regulatory framework that results in a more productive economy by reducing costs to consumers while maintaining safe and reliable electric service with minimum adverse impacts on the environment.” N.H. RSA 374-F:1, I. The Legislature declared that competitive markets (as distinct from traditional cost-of-service regulation) “should provide electricity suppliers with incentives to operate efficiently and cleanly, open markets for new and improved technologies, provide electricity buyers and sellers with appropriate price signals, and improve public confidence in the electric utility industry.” *Id.* at II. The industry has evolved since 1996 and, accordingly, in 2008 New Hampshire authorized utilities to make (and to include in rate base) certain new investments related to generation—but, in contrast to the reliance on fossil and nuclear resources of the past, these new investments are limited to “renewable and clean distributed energy resources.” N.H. RSA 374-G:1 (noting that such investments “provide energy security and diversity by eliminating, displacing or better managing traditional fossil fuel energy deliveries from the centralized bulk power grid”).

Vermont

- Vermont has a number of state energy laws and policies that can only be achieved by reducing load, strategically electrifying the heating and transportation sectors, and meeting demand with renewable energy. *See, e.g.*, 30 Vt. Stat. Ann. § 202a(1), (2) (goals include efficiency, environmentally sound energy supply, and wise use of renewables). Tariffs that support non-renewable resources to the detriment of renewables will adversely impact the State's ability to meet its policy goal of 90% renewable energy across all sectors by 2050.⁹⁴ Such tariffs will also adversely impact Vermont's governing statutory requirements and goals to:
 - Reduce greenhouse gases 50% from 1990 levels by 2028 and 75% by 2050, 10 Vt. Stat. Ann. § 578(a);
 - Supply 25% of all energy use with in-state renewables by 2025, 10 Vt. Stat. Ann. § 580;

⁹⁴ *See* Vermont Department of Public Service, *Comprehensive Energy Plan 2016*, at 2, available at <https://goo.gl/8CxYjU> (90% goal).

- Increase the energy efficiency of 25% of homes by 2020, 10 Vt. Stat. Ann. § 581; and
- Meet 55% of electricity sales with renewable energy by 2017 and 75% by 2032, with 10% coming from small electric generators that are connected to and support Vermont's distribution grid, 30 Vt. Stat. Ann. § 8005(a)(1), (2).

C. Federal Intervention to Prolong the Life of Coal-Fired Power Plants Will Exacerbate the Public Health and Environmental Harms Caused by Such Facilities.

The Proposal's major aim appears to be to halt the market exit and retirement of aging coal-fired power plants. Yet, our states have significantly benefitted from the markets' movement away from coal-fired power plants. With retirements, reduced utilization, and new pollution controls at coal-fired power plants nationwide, air pollution from the power sector has dropped, significantly improving air quality and public health, especially among the elderly, people with respiratory disease, and children.⁹⁵ These improvements include reductions in mercury and other toxic emissions; mercury emissions have fallen 69% since 2000.⁹⁶ In addition, reductions in coal use have helped reduce power sector greenhouse gas emissions that contribute to climate change by 20% since 2005.⁹⁷ The recent reductions in carbon pollution from the power sector—historically the country's largest source of greenhouse gas emissions—are vital to

⁹⁵ See, e.g., U.S. Energy Information Administration, *Sulfur Dioxide Emissions from U.S. Power Plants have Fallen Faster than Coal Generation*, Today in Energy (Feb. 3, 2017), at <https://www.eia.gov/todayinenergy/detail.php?id=29812#> (citing 73% reduction in sulfur dioxide emissions from the power sector between 2006 and 2015); see also MJ Bradley & Associates, *Benchmarking Air Emissions of the 100 Largest Electric Power Producers in the United States*, at 2 (June 2017), available at <http://mjbradley.com/sites/default/files/Benchmarking-Air-Emissions-2017.pdf> ("In 2015, power plant [sulfur dioxide] and [nitrogen oxides] emissions were 87 percent and 79 percent lower, respectively, than they were in 1990.").

⁹⁶ MJ Bradley & Associates, *supra* note 95, at 2.

⁹⁷ See, e.g., U.S. Energy Information Administration, *Carbon Dioxide Emissions from Electricity Generation in 2015 Were Lowest Since 1993*, Today in Energy (May 13, 2016), available at <https://www.eia.gov/todayinenergy/detail.php?id=26232>; MJ Bradley & Associates, *supra* note 95, at 2 ("In 2015, power plant [carbon dioxide] emissions were 20 percent below 2005 levels.").

avoiding the worst effects of climate change⁹⁸ and therefore those reductions provide significant benefits to the states. Prolonging the operation—and air emissions—of coal-fired power plants that would otherwise retire and be replaced by cleaner energy resources would harm our states by threatening this progress in reducing harmful pollution and emissions and would aggravate and worsen the damage to our states that these facilities can cause.

As it did with Order 888, before taking final action on a rulemaking with such significant environmental impacts, the Commission must conduct a full environmental review of the Proposal under the National Environmental Policy Act by preparing an environmental impact statement. *See* 42 U.S.C. § 4332(C).

CONCLUSION

DOE issued the Proposal under section 403 of the Department of Energy Organization Act, a rarely used statutory provision that permits DOE to propose rules for consideration by the Commission. Pursuant to that authority, DOE directed the Commission to take final action on the Proposal within 60 days of its publication of the Federal Register, that is, by December 9, 2017. In light of the numerous pending proceedings before the Commission, in the regional markets,

⁹⁸ EPA has concluded that greenhouse gases, including carbon dioxide, endanger public health and welfare by causing more intense, frequent, and long-lasting heat waves; worse smog in cities; longer and more severe droughts; more intense storms such as hurricanes and floods; the spread of disease; and a dramatic rise in sea levels. *See* Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, 74 Fed. Reg. 66,496, 66,497, 66,524-66,525, 66,532-66,533 (Dec. 15, 2009). These effects harm our state residents, infrastructure, and industries, such as farming, tourism, and recreation, as well as the states' wildlife habitats. *See* Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units, 80 Fed. Reg. 64,682 (Oct. 23, 2015). *See also Our Changing Planet: The U.S. Global Change Research Program for Fiscal Year 2017*, at 2 (Nov. 2016), available at <http://www.globalchange.gov/browse/reports/our-changing-planet-FY-2017> (climate-driven impacts include risks to human health; more frequent and intense storms that threaten food security, infrastructure, and livelihoods; sea level rise and coastal flooding; international stability; and U.S. national security).

and in states that seek to strengthen power system reliability and resource adequacy and to examine the fuel security issues raised by the Proposal, and given the lack of legal basis or factual support for any Commission action similar to the Proposal, the undersigned Attorneys General, state agencies, and state consumer advocates urge the Commission to take final action to decline further consideration of the Proposal and its recommended regulatory changes.

The Honorable Rick Perry
Secretary
U.S. Department of Energy
1000 Independence Ave, SW
Washington, DC 20585

Dear Secretary Perry:

Recent reports indicate that you may be considering the use of obscure provisions of law in an effort to move forward with policies designed to, in effect, bail out coal plants on the backs of American consumers. A previous Department of Energy (DOE) proposal with a similar aim, under the guise of preventing a grid reliability emergency, was already unanimously rejected by the Federal Energy Regulatory Commission (FERC).

In September of 2017, DOE tried to direct FERC to take "immediate action...to require organized power markets to value fuel security" by invoking Section 403 of the Department of Energy Organization Act. FERC unanimously concluded DOE's proposal, which would have led to direct federal support for companies that own merchant coal plants, was not necessary and would harm markets and consumers.¹ FERC made clear that ratepayers should not be forced to subsidize generators that can no longer compete in the electricity market. FERC specifically said, "[T]he Proposed Rule would allow all eligible resources to receive a cost-of-service rate regardless of need or cost to the system. The record, however, does not demonstrate that such an outcome would be just and reasonable." FERC went on, "It also has not been shown that the remedy in the Proposed Rule would not be unduly discriminatory or preferential." FERC's decision to reject DOE's proposal was supported by a broad range of stakeholders, including former commissioners, free-market think tanks, environmental law groups, and the natural gas and oil industries.

However, recent reports indicate DOE is considering an emergency rulemaking under Section 202(e) of the Federal Power Act, Section 215A of the Federal Power Act, or the Defense Production Act of 1950, to support coal and nuclear generators. In your hearing before the House Science Committee on Wednesday, May 9th you said that the Department of Energy is "looking very closely at [a] number of ways to approach this." Attempting to move forward with an emergency rulemaking under Section 202(e) of the Federal Power Act, Section 215A of the

¹ Order Terminating Rulemaking Proceeding, Initiating New Proceeding, and Establishing Additional Procedures, 162 FERC ¶ 61,012 (Jan. 8, 2018)

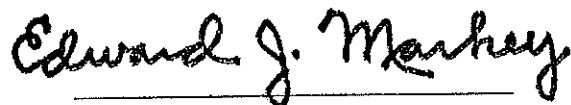

The Honorable Rick Perry
May 14, 2018
Page 2

Federal Power Act, or the Defense Production Act of 1950 to support coal and nuclear generators would not be a proper use of these authorities,

Yet again, a diverse group of stakeholders has urged you to reject these options, including representatives of the natural gas, renewable energy, petroleum oil, independent power plants, and energy efficiency sectors. FERC has already determined that out-of-market payments or subsidies are not appropriate for generators that are not competitive, and the orderly retirement of numerous power plants due to economic reasons does not constitute an "emergency" threat to national security.

I urge you to follow the law and respect the Federal Power Act, and not to attempt to proceed with misusing obscure provisions of law to issue rules to artificially and unnecessarily prop up generators that are no longer competitive.

Sincerely,

A handwritten signature in black ink that reads "Edward J. Markey". The signature is written in a cursive style and is positioned above a horizontal line.

Edward J. Markey
United States Senator

The Honorable Rick Perry
Secretary
United States Department of Energy
1000 Independence Ave. SW
Washington DC 20585

Dear Secretary Perry,

On behalf of the BICEP (Business for Innovative Climate and Energy Policy) network I write to oppose a recent request from FirstEnergy Solutions Corps (FES) for an emergency order under section 202(c) of the Federal Power Act. Such intervention is not necessary to ensure a reliable electricity supply and will raise costs for ratepayers and American businesses that regularly rely on competitive electricity markets to power their operations. Supporting uneconomic power plants in this manner would also have the effect of slowing the deployment of cost-effective renewable and low-carbon energy in many regions of the United States.

Emergency intervention is not necessary or justified in this case. Section 202(c) is intended for situations involving a sudden increase in energy demand or sudden shortage of energy that threatens the reliable supply of energy to consumers. In August of 2017, however, the Department of Energy itself reported that the increased deployment of renewable energy has not posed a threat to grid reliability.ⁱ Recently, PJM - a regional transmission organization operating in areas of the Midwest, Mid-Atlantic, and Southeast, reported that the anticipated retirement of the three FirstEnergy nuclear plants over the coming year would pose no threat to the reliability of electricity service.ⁱⁱ

Furthermore, the Federal Energy Regulatory Commission (FERC) recently rejected a similar proposal from the Department of Energy, finding that there was no significant evidence of a threat to grid reliability.ⁱⁱⁱ The Commission voted unanimously against the immediate implementation of the Grid Resiliency Pricing proposal, citing information provided by regional transmission organizations (RTOs) and independent system operators (ISOs), states, and other industry experts and instead began a process of defining

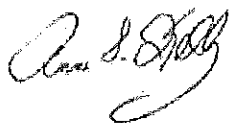

and understanding grid resilience. By attempting to sidestep this ongoing process at FERC, FES is ignoring a large body of evidence against the need for emergency intervention.

Using emergency authority to support FirstEnergy's plants would result in increased costs for electricity customers. As major consumers of energy in the US, companies in the BICEP network - and many others - rely on reasonably priced, readily available energy. Increased costs, which are unnecessary in this case given the reasons above, are passed on to ratepayers, which include not only American households but also major businesses. The proposed order would increase operating costs, such as energy inputs, and raise the cost of production of US goods without any tangible benefit. Competitive energy markets, where they exist, should be allowed to provide solutions that ensure reliability on their own - and they do. In fact, FERC commissioner Rob Powelson said on May 2, 2018 about FirstEnergy's request, "These old inefficient power plants need to retire. You can't have a market when you're sending wrong price signals to people who need to enter and exit."^{iv}

Providing uneconomic plants with arbitrary cost assurances also slows down the transition to and adoption of renewable energy, the cost of which has dropped - and continues to drop - significantly in recent years. Companies in the BICEP network, among others, have made ambitious renewable energy procurement commitments. In fact, nearly half of all Fortune 500 companies have set targets to reduce greenhouse gas emissions, improve energy efficiency, and/or increase renewable energy sourcing. Overall, Fortune 500 companies that have set goals collectively to save nearly \$3.7 billion annually through their clean energy and energy efficiency initiatives.^v Because supporting plants that cannot compete with lower cost energy sources would slow the deployment of increasingly affordable renewable energy, doing so would also harm US businesses.

I welcome the opportunity to discuss this issue further, and respectfully request that you reject the FES request for an emergency order under section 202(c) of the Federal Power Act. Thank you for your time and consideration. Please contact me at kelly@ceres.org if you have any questions.

Sincerely,

Anne Kelly

Subject: IPAA Concerns About Initiatives to Address Electric Power Generation Resiliency
Date: Thursday, May 17, 2018 1:52:56 PM
Attachments: [IPAA Letter to DOE Secretary Perry on Resiliency 05-17-2018.pdf](#)

Please find attached a letter from the Independent Petroleum Association of America and other national and state oil and natural gas production industry associations urging the Department of Energy to refrain from imposing any action under the Department of Energy's emergency authorities to provide economic support favoring a particular class of power plants, as proposed by First Energy Solutions and its affiliates. These organizations believe that there is no emergency or threat to the national defense on which the Department could lawfully base the exercise of its emergency authorities. Consequently, we urge the Secretary to focus the Department's efforts on encouraging production and use of all fuels—a result that can only be achieved by rejecting calls to artificially inflate one source over another.

We appreciate the opportunity to supply this information and look forward to working with the Department to find sound solutions to assure the resiliency of the nation's power grid.

Lee Fuller

Executive Vice President

Independent Petroleum Association of America

May 17, 2018

By Electronic Submission

The Honorable James Richard Perry
Secretary of Energy
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Secretary Perry:

This letter urges you to refrain from imposing any action under the Department of Energy's emergency authorities to provide economic support favoring a particular class of power plants, as urged by First Energy Solutions and its affiliates. It is submitted on behalf of the Independent Petroleum Association of America (IPAA), the American Exploration & Production Council (AXPC), the Association of Energy Service Companies (AESC), the International Association of Drilling Contractors (IADC), and the following organizations:

Colorado Oil & Gas Association
Florida Independent Petroleum Association
Kansas Independent Oil & Gas Association
National Association of Royalty Owners
Ohio Oil & Gas Association
Oklahoma Independent Petroleum Association
Oklahoma Oil and Gas Association
Pennsylvania Independent Oil & Gas Association
Texas Alliance of Energy Producers
Texas Independent Producers and Royalty Owners Association

Collectively, these groups represent the thousands of independent oil and natural gas explorers and producers, as well as the service and supply industries that support their efforts, that will be the most significantly affected by the actions resulting from this regulatory proposal. Independent producers drill about 90 percent of American oil and gas wells, produce 54 percent of American oil and produce 85 percent of American natural gas.

The signatories ("Independent Producers") support the letter submitted to you on May 7 by a group of natural gas, renewables, and power efficiency groups ("Industry Groups"), detailing the legal infirmities of taking action under Section 202(c) of the Federal Power Act (FPA), the Defense Production Act, and Section 215A of the FPA. As explained in the group's legal analysis:

"There is no emergency or threat to the national defense on which the Department could lawfully base the exercise of its emergency authorities."

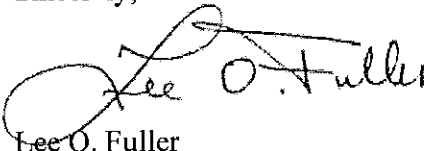

The Independent Producers have succeeded in dramatically increasing production of natural gas, bringing environmental benefits and lower electricity prices. These efforts should not be derailed by an attempt to forestall the retirement of older, uneconomic generators. With the focus on PJM, even PJM Interconnection, LLC, pointed out to the Secretary that the Department does not need to take "precipitous, immediate action" to address the corrective action requested by FirstEnergy Solutions and its affiliates. PJM stated unequivocally that "there is no immediate threat to system reliability," in its March 30, 2017, letter.

As the Industry Groups stated, "FirstEnergy's true problem is not that there is an emergency on the grip, but that its power plants lose money at current prices."

The Federal Energy Regulatory Commission ("FERC") continues to review how Independent System Operators ("ISOs") and Regional Transmission Organizations ("RTOs") manage reliability and resiliency. If changes in the pricing of power are necessary, organized markets can and are working with stakeholders, with the end product being a filing with FERC. Even without a FERC filing, independent system operators and regional transmission operators can find that certain units proposed for retirement are, in fact, necessary for system reliability and offer contracts to keep those plants on line. PJM has not made such a finding with respect to the FirstEnergy generators.

All energy sources have experienced cycles in production and/or demand. The decreased demand for coal and nuclear energy, particularly within PJM, is due in large part to the abundance of lower-cost natural gas and overall decreases in power demand. The Independent Producers urge the Secretary to focus the Department's efforts on encouraging production and use of all fuels—a result that can only be achieved by rejecting calls to artificially inflate one source over another. FERC and the independent system operators can continue with their efforts to ensure the reliability and resiliency of our nation's electric grid.

Sincerely,

Lee O. Fuller
Executive Vice President
Independent Petroleum Association of America

May 10, 2018

Honorable Donald J. Trump
President of the United States
The White House
1600 Pennsylvania Avenue
Washington, DC 20500

Dear Mr. President:

On behalf of Citizens Against Nuclear Bailouts — a diverse coalition of Pennsylvania citizens' groups, power generators and energy, business and manufacturing associations — we are writing in opposition to the petition from FirstEnergy Solutions (FES) for an emergency order under the Federal Power Act.

FES' petition is a Hail Mary attempt from an insolvent corporation to acquire a federal government-funded bailout. The company's request comes as a result of its financial mismanagement, and now it expects hardworking Americans to pay more for electricity to continue its operations.

This request from FES is not the first time it has sought federal or state government intervention. It previously tried, to no avail, to acquire subsidies from Ohio consumers and from the Federal Energy Regulatory Commission. Now, FES is asking the federal government to invoke a wartime power to make its business immune to electricity competition. This action undoubtedly would shift increased financial burden onto consumers.

Any federal intervention would contradict this administration's objectives to achieve energy dominance, improve American infrastructure and grow our economy. Granting the order would undermine competition, harming low U.S. energy prices, stifling new investments and innovation, and signaling that the administration favors one form of energy over others.

Should FES nuclear plants be shuttered, the grid would remain reliable and resilient. PJM Interconnection, the regional transmission operator of the electric grid and markets that the FES plants serve, has indicated that closure of the FES plants would not present reliability concerns. Given PJM's critical role in ensuring grid reliability, its assurances are a clear illustration that the closure of FES' plants is not an emergency, as its petition claims.

To be clear, our coalition values all sources of energy, so long as power generation industries compete by the same rules, without government mandates or subsidies.

Energy competition has provided innumerable benefits, including lower electricity prices, to customers and businesses. In Pennsylvania, this has produced a competitive energy marketplace with prices below the national average. Approving FES' request would disrupt the marketplace and increase rates for our seniors, small businesses, manufacturers, transit systems, hospitals, schools, municipal governments and more. These higher energy prices would burden our federal government by increasing operational costs.

**NONUKE
BAILOUT**

Section 202(c) of the Federal Power Act states that an emergency may be declared during the continuance of any war or when a sudden increase or shortage exists. It is not meant to be used to bail out a company that failed to adapt to competition. We trust you will see that this attempt does not require an emergency order and that you will remain committed to protecting energy competition and the free market, which have made our country the envy of the world.

Sincerely,

Citizens Against Nuclear Bailouts

Citizens Against Nuclear Bailouts is a diverse coalition of Pennsylvania citizens' groups, energy consumers, power generators and energy, business and manufacturing associations opposed to any federal or state effort to require consumers to pay higher energy bills to bail out the nuclear energy industry in Pennsylvania.

Smart American Energy in Carroll County

CLEAN ENERGY FUTURE

May 21, 2018

The Honorable James Richard Perry
Secretary of Energy
United States Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Re: FirstEnergy Solutions' Request for Emergency Relief under Section 202 of the Federal Power Act and/or the Defense Production Act of 1950

Dear Secretary Perry:

The Ohio Independent Power Producers (Ohio IPP), a nonprofit trade association representing the interests of developers and operators of new power plant investments in Ohio, writes to express its strong opposition to the above-referenced request filed by FirstEnergy Solutions and affiliates (FES) on March 29, 2018.¹ FES' request for emergency relief is not needed for grid reliability and will threaten continued private innovation and investment in new generation assets.

- I. The Ohio IPPs are investing billions of dollars in private capital in new, efficient, and reliable generation technology to provide lost-cost energy to millions of consumers.**

The new natural gas power plants in Ohio account for approximately \$10 billion in new private sector investment and the creation of over 14,000 construction jobs. These projects range from those already in commercial operation to projects in the advanced stages of preconstruction development.² The new plants play a critical role in meeting our region's electricity needs, while also driving economies in the communities where we operate. Our projects will generate approximately 10GW of reliable, efficient and clean electricity, powering millions of businesses and homes across the region. More such projects are planned if the competitive market is allowed to function.

¹ Signatories to this letter include the Oregon Clean Energy Center, an 800 MW facility in commercial operations; Carroll County Energy, a 700 MW facility in commercial operations; the Lordstown Energy Center, a 940 MW facility under construction; the Trumbull Energy Center, a 940 MW facility approved by the Ohio Power Siting Board; the Oregon Energy Center, a 955 MW facility approved by the Ohio Power Siting Board; and the Guernsey Power Station, a 1650 MW facility approved by the Ohio Power Siting Board.

² Attached to this letter is a map showing the new natural gas power plant investment in Ohio and the stage of development for each project.

Our projects are also driving significant ancillary infrastructure development, including hundreds of miles of new natural gas transmission pipelines. These infrastructure investments create a platform for additional economic development opportunities for the communities in which we operate.

This investment in new generating facilities has been led by the relatively low cost of natural gas due to the abundant supplies in the Marcellus and Utica shale formations, as well as innovations in gas generation technology increasing plant efficiency. In addition, price signals from the PJM Interconnection's (PJM) competitive markets encourage investment in new generation to replace aging and uneconomic assets. These factors result in low cost production of electricity.

II. Granting FES' request for emergency relief is not needed for grid reliability.

Despite FES' assertions, there is simply no evidence that the retirement of certain FES coal and nuclear facilities will create an "emergency condition" in upcoming years. The North American Electric Reliability Corporation State of Reliability 2017 report found that the United States' Bulk Power System was adequate, with the CEO commenting that the *"state of reliability in North America remains strong, and the trend line shows continuing improvement year over year."* Indeed the U.S. Department of Energy's (Department) own staff report, which preceded the Department's Notice of Proposed Rulemaking in August 2017, concluded that system *"reliability is adequate despite the retirement of a portion of baseload capacity and unique regional hurdles posed by the changing resource mix."*

Moreover, there is no evidence of any potential reliability emergency within the PJM region. PJM maintains reliability of the electric power system within its footprint through market-based mechanisms and has consistently maintained its target reserve margin to serve peak loads. PJM supplements the energy and ancillary service revenues earned by generators in the day-ahead and real-time markets through its Reliability Pricing Model ("RPM") market. The RPM market is a capacity market that ensures there are sufficient capacity resource products available to maintain system reliability. The design of the RPM market has evolved over time, and PJM has demonstrated that it will make modifications to the market design to address changing reliability needs of customers and to ensure that sufficient capacity resources are available to maintain system reliability.³

PJM will also examine the specific impacts to the stable and reliable operation of the grid as a result of the retirement of certain FES coal and nuclear plants. Under its tariff, PJM will conduct a thorough analysis to determine whether the announced retirements will present systemic adequacy issues or any local reliability issues.⁴ In the event that PJM finds that the retirement of an FES plant will result in an adequacy or reliability issue, PJM will address the issue with a variety of tools, including, if necessary, offering full cost-of-service compensation to induce FES' assets to remain online.⁵ Thus far, PJM has

³ For example, PJM proposed further revisions to the RPM market to address potential reliability issues raised by the extremely cold weather experienced in January and February of 2014. PJM proposed to increase the performance incentives for capacity resources to be available when needed most, help reduce price spikes during system emergencies, and reduce the chance of expensive forced outages (the PJM Capacity Performance Proposal). FERC subsequently approved, with modification, the PJM Capacity Performance Proposal.

⁴ See, Part V of the PJM Tariff.

⁵ Further, PJM indicated, in a March 30, 2018 letter to the Department regarding the above-referenced request, that it could join FES' request for emergency relief if PJM's remedial options prove to be insufficient to address a potential adequacy or reliability issues resulting from the retirement of FES' coal and/or nuclear facilities. PJM's

indicated that it does not expect the power plant deactivations planned by FES to adversely affect the reliability of the PJM system.⁶

III. Granting FES' request will undermine new innovation and investment, with the result of harming grid reliability.

PJM has been successful sending appropriate pricing signals to encourage new investment in the market to replace uneconomic assets. As a result, of billions of dollars in new capital has been invested in competitive power generation facilities. Built largely to leverage abundant, domestic shale gas resources, these facilities are generating reliable, around-the-clock power for millions of consumers throughout the PJM region. Interference with the competitive market by granting FES' request, however, would jeopardize the competitive market structure that makes investment in new, efficient technology possible, as well as risk thousands of jobs. Simply put, picking winners and losers fundamentally skews this process and, by default, slows the pace of positive innovation and investment. As a result, consumers will face higher prices.

Indeed, granting FES' request will likely harm grid reliability by chasing away the very innovation and investment in new generation needed to maintain the long-term integrity of the grid.

We urge the Department to maintain the competitive electricity markets and reject the FES' request for emergency relief under Section 202 of the Federal Power Act and/or the Defense Production Act of 1950.

Respectfully submitted,

Apex Power Group

Caithness Energy

Clean Energy Future

Lordstown Energy Center

Oregon Clean Energy

Carroll County Energy

cc: Members of the Ohio Congressional Delegation

reasoned explanation highlights that there is simply no need for the Department to take immediate action to grant FES' request.

⁶ See, PJM "Generation Deactivation Notification Update" (May 3, 2018), available at <http://www.pjm.com/-/media/committees-groups/committees/teac/20180503/20180503-teac-generation-deactivation-notification.ashx>.

Compiled by Bricker & Eckler LLP

May 24, 2018

**UNITED STATES DEPARTMENT OF ENERGY'S
USE OF FEDERAL POWER ACT EMERGENCY AUTHORITY**

Comments of Microsoft Corporation

Microsoft Corporation ("Microsoft") appreciates the opportunity to offer these comments on the appropriate use by the U.S. Department of Energy ("DOE" or "the Department") of emergency authority under sections 202(c) or 215A of the Federal Power Act or under the Defense Production Act of 1950. Microsoft believes it is critical that the Department consider the perspective of large corporate energy consumers, such as Microsoft, that actively purchase energy in FERC-jurisdictional markets like the PJM energy market and that require resilient and reliable 24 x 7 energy supply for their operations.

Microsoft uses an increasingly large amount of electricity to power our datacenters throughout the nation, and depends upon a very high degree of reliability in order to meet its always-on uptime commitments to its customers. Microsoft has seen no evidence of the kind of imminent emergency that would warrant DOE's exercise of its emergency authorities. Moreover, there is no basis for invoking the extraordinary step of broad-scale intervention in the operations and price-setting of the competitive wholesale electricity markets. Rather, Microsoft's experience shows that market-based regulatory policies enable the adoption of cost-effective technical innovations that lower consumer costs and enhance grid reliability, without the need for disruptive and unfair out-of-market interventions. We have found that a competitive electricity market structure is essential to driving lowest-cost supply while maintaining reliability. We've also found that a market-based approach best enables our development of innovative approaches that enhance grid reliability, lower costs and also achieve the cleaner generation demanded by our customers.

Microsoft has not seen any evidence to date that an interventionist approach is necessary to improve the resiliency, reliability, or any other aspect of the power system. Instead, Microsoft is deeply concerned that the particularized use of Federal Power Act emergency authorities sought by FirstEnergy

Solutions Corp. (“FirstEnergy”) in its March 29, 2018, Petition to the Secretary, is unwarranted, unnecessary, and unwise for energy consumers and the broader market of energy suppliers. The requested emergency intervention would reward uneconomic facilities and lagging technologies, forcing their subsidization by ratepayers, thus distorting energy markets in ways that will increase energy prices for all consumers, reduce competition, impede innovation, and actually stand in the way of continued expansion of a more resilient and environmentally sustainable grid.

FirstEnergy’s Petition, and the ongoing Federal Energy Regulatory Commission (FERC) rulemaking inquiry on grid resilience and reliability, certainly raise important questions about the ability of the power system to sustain itself during -- and to recover from -- sabotage and natural disasters. Microsoft believes that it is important to air these concerns and ensure they are being addressed. In many cases, companies like Microsoft have already been investing in assets and technologies to help increase the resiliency and reliability of the grid. Continuing the current market-based approach would support such innovation by Microsoft and other players in the energy market. An affordable, reliable, resilient -- and environmentally sustainable -- electricity system is vital to our business, as well to the economic and national security of the United States. Innovation and market operations remain the surest pathway to achieving fuel diversity and a more resilient grid. However, granting relief under the Petition would require the imposition of cost-of-service (“CoS”) regulation on the PJM market, thereby undermining market competition. Accordingly, Microsoft believes that the action requested by the Petition would not advance resiliency or reliability nor help assure energy security for the country.

Microsoft’s long-term energy planning needs benefit from a stable regulatory framework that embraces market-based structures. Competition in PJM and other FERC- jurisdictional power markets has benefited U.S. consumers by providing reliable, affordable electricity service and, more recently, has

facilitated a market-based platform that encourages deployment of innovative and cost-competitive clean energy products and services.¹

Microsoft has deep concerns that granting relief under the Petition would introduce instability into competitive markets that will increase both costs and price volatility for consumers, as well as reduce customer choice -- all undesirable outcomes without gains to grid resiliency.

I. Microsoft's extensive investment in the future of the U.S. power system as a large energy consumer, a clean energy purchaser, and an innovator in energy technology demonstrates the path toward enhanced grid reliability.

Microsoft has three principal areas of interest in the U.S. power sector. *First*, Microsoft is a large electric energy consumer with significant operations in multiple FERC-jurisdictional markets, including PJM. *Second*, this energy powers mission-critical operations for Microsoft, a key element of which is the highly reliable provision of electricity to run our business and meet our commitments to customers. For example, Microsoft's U.S. datacenter operations require a continuous uninterruptible supply of power to run Microsoft cloud services and live up to our always-on commitments to our customers. *Third*, to meet growing customer demands for sustainable products and services, Microsoft has made major public commitments to use power from clean energy sources. To help meet these commitments, Microsoft has announced major investments of its own in clean energy generation, cutting-edge technologies, and partnerships with utilities, all of which benefit from competition in power markets.

The Petition identifies reliability and resiliency as key risks facing PJM, highlighting several extreme weather events that led competitive energy markets to increase temporarily the deployment of baseload coal and nuclear generation -- resources that are now faced with eventual phase out as being

¹ Several recent studies from premier academic and market sources have found that competitive power markets provide consumers with billions of dollars in savings of energy supply and services. Not only have competitive markets supported customer planning and reliability needs, but they have also served as a platform for deploying innovative clean energy technologies. See Steve Cicala, "Imperfect Markets versus Imperfect Regulation in U.S. Electricity Generation," University of Chicago, Jan 22, 2017. Available at: http://home.uchicago.edu/~scicala/papers/elec_gov_v_mkt_draft_2.pdf. Also see PJM Interconnection, "Resource Investment in Competitive Markets," May 5, 2016. Available at: www.pjm.com.

uneconomic. The Petition seeks to address the risks of occasional weather events by locking in the use of these baseload generation resources with subsidies, resulting in market-distorting price hikes for energy consumers. There is no credible evidence from any other source that these generators are needed to address reliability or resiliency needs of the PJM market or even that there is a reliability or resilience problem. Instead, Microsoft's own experiences in securing power in the PJM market, which represents one of Microsoft's biggest datacenter regions and hence one of its largest markets for securing power, is that there has not been a reliability or resiliency issue with its own energy procurement. Instead, the PJM market is one where Microsoft has successfully invested in new sources of energy generation and pursued other energy innovations. Microsoft firmly believes that market-based solutions and advanced energy technologies hold the key to increasing energy resilience and security in the United States. Microsoft's own experience has shown that innovations such as demand response, energy storage, and flexible fast-start resources -- resources facilitated by well-structured market operations -- can help increase reliability and resiliency and help prepare the U.S. power system for ever-greater quantities of generation from renewable energy.²

Nor have we seen any first-hand evidence that the growth in renewables or natural gas generation, or other nimble forms of grid resilience management, has resulted in a threat to grid reliability. We believe that this conclusion was borne out by the recent DOE Staff Report to the Secretary on Electricity

² The deployment of renewable energy continues rapidly across the United States, as corporate and public policy drive investment into the industry. According to the Advanced Energy Economy, 71 companies within the Fortune 100 have set public renewable energy or sustainability targets. According to the American Wind Energy Association, corporate and other non-utility customers held more than 50% of new wind power contracts signed in 2015. To put these numbers into context, the Lawrence Berkeley National Laboratory finds that today's existing state Renewable Portfolio Standards (RPS) goals would require more than 60 GWs of new renewables build by 2030 -- the same GW development goals that the Renewables Energy Buyers Alliance has targeted for corporate buyers by 2025.

Markets and Reliability.³ Indeed, on the whole, PJM has demonstrated ample capacity through this mix of resources to meet even its most extreme demand.⁴

Microsoft's innovative power plan for its Cheyenne, Wyoming datacenter shows how highly capable onsite energy systems at our datacenters can be deployed to provide flexible capacity to the grid when needed, bringing new generation resources into the grid in a far more nimble manner. In Cheyenne, Microsoft offered the use of its onsite natural gas backup generators as a secondary resource for the grid.⁵ This helped increase reliability and resiliency for the grid without additional costs for ratepayers, in that it avoided the need for ratepayers to pay for a new power plant or to perpetuate old, uneconomic ones. Microsoft is deeply concerned that were the Petition granted, continued innovation by major energy consumers will be stifled and the motivation for existing power providers to seek out and cooperate with customers in realizing such innovative approaches will be dampened by the perception that extraordinary relief will instead become available.

II. Consumers benefit from competition in power markets, which have provided low cost, reliable power.

U.S. businesses require steady delivery of electricity to maintain their operations, and are also sensitive to energy costs and concerns about power system resiliency. While Microsoft shares the resiliency goals that seem to animate the Petition and FERC's regulatory proceedings on resiliency, we

³ U.S. Dep't of Energy, Staff Report to the Secretary on Electricity Markets and Reliability (August 2017)(*available at* https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf)

⁴ PJM's most recent capacity auction yielded a 23.9% reserve margin, which well exceeds its target of 16.6%. PJM's analysis of the deactivation notice from FirstEnergy regarding the retirement of three units (in 2020 and 2021) found "the deactivation of these generating units is not expected to adversely affect the reliability of the PJM Transmission System due to a combination of remedial measuresWith these measures, the PJM Transmission system will remain reliable, and therefore the generating units listed above may plan to deactivate as scheduled." PJM Comments on 202(c) application (available at: <http://www.pjm.com/-/media/documents/other-fed-state/20180430-motion-to-Intervene.ashx>).

⁵ See Brad Smith, Microsoft's President and Chief Legal Officer, Blog Post (Nov. 14, 2016) ("With our latest energy deal, Microsoft's Cheyenne datacenter will now be powered entirely by wind energy, keeping us on course to build a greener, more responsible cloud.")(available at <https://blogs.microsoft.com/on-the-issues/2016/11/14/latest-energy-deal-microsofts->).

are deeply concerned that the precipitous actions called for could actually undermine resiliency by disrupting the core functions of wholesale markets. In particular, compensating selected generating units via CoS, while other generating units depend upon market-based payments, would disrupt the ability of markets to send accurate, least-cost price signals for new innovative investments. It is also difficult to understand how CoS in FERC-jurisdictional markets such as PJM could result in just and reasonable rates for consumers.

This approach of increased use of CoS in FERC-jurisdictional markets could also trigger recurring requests for policy intervention to prevent retirements by other uneconomic generating units that do not receive cost recovery assurance. Many older generating units that have been retired also faced situations virtually identical to that facing FirstEnergy. Thus, action to provide relief under this Petition seems likely to create an unintentional ‘un-virtuous cycle,’ where costs to consumers become increasingly detached from actual wholesale market prices. Indeed, FirstEnergy’s Petition cites that, “[i]n the past four years, over 11,000 MW of coal-fired generation has closed in PJM, the equivalent of a dozen large power plants.” Petition at 7, 19. The dynamic of an effort to resuscitate uneconomic generation could jeopardize some of the key benefits to consumers afforded by competitive power markets, namely transparent, best-in-price electricity that can be managed through a portfolio or with traditional financial instruments (e.g. hedging). The perception of a non-level playing field may also dissuade new resources from entering the market, thereby hampering the development of the lowest cost energy supply.

In energy-intensive industrial applications, like datacenters, these benefits are essential for maintaining reliable operations and planning new capital investments for our business. The availability of cost-competitive, reliable, market-based electricity rates in a consistent policy environment is a critical factor in Microsoft’s decision-making for developing and siting new datacenter sites. Where policy uncertainty threatens the stability of electricity markets, it undermines the attractiveness of these regions for future economic development.

III. Competitive markets encourage the technology innovation behind a cleaner and more resilient power system.

The very essence of market-based competition is that uneconomic sources of generation get replaced by more economic ones – not that they are simply perpetuated at rate-payer expense, as the Petition seeks. Those sources that are no longer able to compete on an economic basis are appropriately shut down as more economic replacement generation becomes available. That scenario is not an emergency – it is, rather, evolutionary, fully appropriate and beneficial. Competition in FERC-jurisdictional power markets has spurred innovation in a wide range of technologies that support a more resilient grid, including battery storage, fuel cells, and a host of renewable energy technologies. Transparent pricing, market-based services on a level playing field, and technology-neutral market governance in competitive markets represent durable foundations for ongoing innovation.

Conversely, CoS for selected units in competitive markets deviates from the core principle of market-based discovery of costs and value. As a result, relief under the Petition would send inaccurate price signals to consumers about the actual costs and market value of electricity. Among the key benefits of competitive markets is their ability to accurately reflect the least-cost sources of electricity production, such that corporate consumers have visibility into their cost structures and can make informed business decisions about investment and energy technology needs. By extension, accurate pricing sends signals to entrepreneurs and researchers to develop new energy products and services to meet consumer demands. If the power system becomes defined by distorted wholesale prices eroded by non-market CoS intervention within a competitive market environment, and imposes higher non-bypassable price increases on end-users, the resulting economic dynamics would stifle price signals for the development and deployment of innovative energy products and services.

Furthermore, the current competitive market rules overseen by FERC already contain adequate provisions to provide discrete targeted relief in the event there are individual, uneconomic generating

resources that must be retained to avoid unacceptable reliability risks throughout PJM and other competitive electricity markets. PJM and other RTOs/ISOs have the ability to make reliability must run designations of selected resources and FERC has the authority to approve such designations for CoS rates on a year-by-year or shorter basis. These designations are made pursuant to a set of well-developed rules under applicable FERC-approved tariffs. And while no RTO or ISO identified an urgent reliability or resilience problem, FERC, in response to the Secretary's Notice of Proposed Rulemaking on Grid Resilience, is now conducting an inquiry to develop a common understanding of resilience, identify how RTOs and ISOs assess resilience, and examine how RTOs and ISOs mitigate threats to resilience in a market context. Accordingly, there is no need for the heavy-handed imposition of CoS regulation here or independently of FERC's ongoing inquiry.

IV. DOE does not have the authority to invoke emergency powers under the Federal Power Act or the Defense Production Act to address this general, non-exigent market evolution.

The Petition seeks to distort DOE's authorities far beyond the limited relief valve that Congress created under the Federal Power Act. Section 202(c) was not designed to allow the Department to supersede FERC's authority over wholesale rates on a scale that could pertain here and on the basis of a slowly unfolding and fully predictable set of market dynamics. As the Department's own regulations make clear, this provision was designed to address imminent and unexpected, temporary outcomes: "'Emergency,' as used herein, is defined as an unexpected inadequate supply of electric energy which may result from the unexpected outage or breakdown of facilities for the generation, transmission or distribution of electric power." 10 CFR Part 205.371. The Petition seeks to extend this limited grant to entirely new and largely unbounded circumstances that are otherwise addressed through PJM's and FERC's rulemaking processes and rate structures. It seeks to depict as an emergency the slow evolution of the electric generation market that has been underway for years. Petition at 26-27. Indeed, the only emergency the Petition cites is that facilities "continue to retire prematurely" (Petition at 12) -- hardly the imminent threat the Act and its regulations contemplate.

To the extent that the Petition may identify shortcomings with the regulation of natural gas distribution system reliability as the overall grid has become more dependent upon natural gas generation, Petition at 23 (citing the absence of a NERC equivalent for natural gas), it proposes the wrong cure. The logical remedy for this challenge is to enhance the reliability of the natural gas supply and transportation system and retain dual fuel capabilities, rather than to override competitive energy markets.

Nor does the Defense Production Act provide any other legitimate basis for action. That law, which was enacted in 1950 at the beginning of the Korean War, is designed to authorize rare and extraordinary market interventions critical for pressing national defense needs attendant to a wartime effort. The Defense Production Act does not allow the government to set prices or force market participants to buy products or services they do not wish to buy. 50 U.S.C. App. 2061 et seq.

Similarly, the more recently enacted FAST Act, which added new section 215A to the Federal Power Act, only authorizes the Department of Energy to issue temporary “orders for emergency measures” in response to a “grid security emergency.” A “grid security emergency” is defined as the occurrence or imminent danger of cyberattacks, electromagnetic pulse attacks, geomagnetic storms, and direct physical attacks that would have significant adverse effects on the reliability of critical electric infrastructure. Orders providing for “emergency measures” may last only fifteen days before an additional emergency finding is required. 16 U.S.C. section 215A(a)(7). These circumstances are not presented by the gradual and successful market evolution described by the Petition and the PJM response, nor is the remedy proposed limited in time as contemplated in the FAST Act.

Microsoft urges the Secretary to consider carefully the negative impacts on end-users regarding economic development, technology deployment, and innovation that would come from granting the extraordinary intervention that is being sought. The goals of grid reliability and resilience are better served through the on-going FERC and RTO/ISO regulatory processes that are convening power industry stakeholders to establish the technical and commercial directions necessary to prepare wholesale markets

for an influx of new technologies and consumer preferences that advance reliability and resiliency.

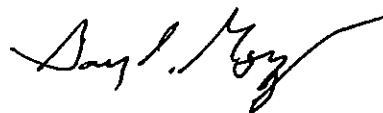

Please do not hesitate to reach out for more information should further perspective be helpful.

RE: Motion of the Office of Ohio Consumers' Counsel to Intervene

Dear Secretary Perry, Assistant Secretary Walker and Deputy Assistant Secretary Jereza:

Attached is The Office of the Ohio Consumers' Counsel's ("OCC") Motion to Intervene and Protest in the proceeding concerning FirstEnergy Solutions Corporation's ("FES") extraordinary Request for Emergency Action Under Section 202(c) of the Federal Power Act ("Request"). OCC is the statutory representative of residential utility consumers in the State of Ohio, consumers that would be adversely affected if FES' request is granted.

OCC opposes FES' Request for emergency action because there is no emergency and no justification for the relief requested. Additionally, FES' Request would require consumers in Ohio and elsewhere in the PJM region to subsidize FES' (and others) coal and nuclear plants. Requiring customers to subsidize certain coal-fired and nuclear facilities in PJM would also result in unjust, unreasonable and unduly discriminatory rates for Ohio consumers and consumers throughout the PJM region. Subsidizing certain power plants would also undermine the functioning competitive wholesale market that provides consumers reliable electric service at the lowest possible cost.

**UNITED STATES OF AMERICA
BEFORE THE
DEPARTMENT OF ENERGY**

Request for Emergency Order Pursuant)
To Federal Power Act Section 202(c)) DOE Docket No. ____
by FirstEnergy Solutions Corporation.)

**MOTION TO INTERVENE
OF
THE OFFICE OF THE OHIO CONSUMERS' COUNSEL**

The Office of the Ohio Consumers' Counsel ("OCC") moves to intervene in this matter and urges Energy Secretary Perry to reject the March 29, 2018 Request for Emergency Order, submitted by FirstEnergy Solutions Corporation ("FES"). No emergency condition exists warranting the extraordinary relief FES seeks that would require customers to subsidize certain power plants. Requiring customers to subsidize certain coal-fired and nuclear facilities in PJM would also result in unjust, unreasonable and unduly discriminatory rates for Ohio consumers and consumers throughout the PJM region. Subsidizing certain power plants would also undermine the functioning competitive wholesale market that provides consumers reliable electric service at the lowest possible cost.

I. PROCEDURAL BACKGROUND

On March 29, 2018, FES issued a letter ("Request") to Energy Secretary Perry requesting that the United States Department of Energy invoke emergency authority under Section 202(c) of the Federal Power Act ("FPA") to find that an emergency

condition exists in the PJM Interconnection, L.L.C. ("PJM") regional transmission organization. In its request, FES requests that the Secretary order PJM to enter into contracts with "certain existing nuclear and coal-fired generators" located in PJM for the supply of energy, capacity, and ancillary services to "maintain the stability of the electric grid." FES also requested that the Secretary order PJM to "promptly compensate at-risk merchant nuclear and coal-fired power plants for the full benefits they provide." FES served the Request on numerous affected parties.

II. COMMUNICATIONS

Correspondence and communications concerning the submission should be directed to:

Kevin Moore
Assistant Consumers' Counsel
Office of the Ohio Consumers' Counsel
65 East State St., 7th Floor
Columbus, Ohio 43215
Kevin.Moore@occ.ohio.gov

III. MOTION TO INTERVENE

OCC is the State of Ohio's statutory residential utility consumer advocate. OCC represents the interests of approximately 4.5 million Ohio residential utility customers in proceedings before state, and federal administrative agencies, and the courts.¹ OCC is an active participant in numerous state and federal regulatory proceedings, and represents Ohio residential consumers located within the PJM region. OCC advocates for affordable

¹ See Ohio Revised Code, Chapter 4911.

and reliable utility services at just, reasonable, and nondiscriminatory rates for all residential consumers within Ohio.,

The grant of FES' Request by the DOE would result in unwarranted subsidy payments to certain coal-fired and nuclear facilities in PJM. The cost of those payments likely would be collected from consumers throughout the PJM region, including the Ohio residential consumers that OCC represents. Such payments are likely to significantly increase the retail electricity rates paid by Ohio consumers. OCC opposes FES' Request and reserves the right to supplement this preliminary pleading to explain in detail why the Request should be rejected.

As required by Rule 214(b)(2), OCC states that the DOE's ruling in this matter may have a significant and adverse effect on the rates paid by Ohio's residential utility consumers. OCC moves to intervene² in this matter to protect the interests of these Ohio residential consumers who could be directly and adversely affected by this proceeding. As the statutory representative of Ohio residential consumers, OCC has a direct and substantial interest in this proceeding. No other party can represent this interest. OCC's intervention in this proceeding is in the public interest. OCC should be granted intervention as a party with all of the rights appurtenant to that status.

IV. STATEMENT OF OPPOSITION

As required by Federal Energy Regulatory Commission ("FERC") Rule 214(b)(1), the OCC's preliminary position on FES' Request is that OCC opposes granting the relief FES seeks. The available evidence (not cited in FES' Request but well documented in the comments submitted by OCC and other parties in FERC Docket No. RM18-1-000)

² See Rule 214 of the FERC's Rules of Practice and Procedure.

demonstrates that no emergency condition exists. The available evidence also demonstrates that the requested relief is unnecessary, would result in an unreasonable increase in rates paid by consumers, a less reliable electric grid, and damage to the functioning competitive wholesale market that provides consumers reliable electric service at the lowest possible cost.

V. CONCLUSION

For the foregoing reasons, OCC requests that (a) its motion to intervene be granted; (b) it be permitted to participate in this proceeding with full rights as a party; and (c) DOE reject FES' request for extraordinary emergency relief.

**UNITED STATES OF AMERICA
BEFORE THE
DEPARTMENT OF ENERGY**

Request for Emergency Order Pursuant)
To Federal Power Act Section 202(c)) DOE Docket No. ____
by FirstEnergy Solutions Corporation.)

**PROTEST
OF
THE OFFICE OF THE OHIO CONSUMERS' COUNSEL**

To protect Ohioans (and others) from paying subsidies and above-market prices for electricity, the United States Department of Energy (“DOE” or “the Department”) should reject the Request for an Emergency Order (“Request”) submitted by FirstEnergy Solutions Corporation (“FES”) on March 29, 2018. That request would require consumers in Ohio and elsewhere in the PJM Interconnection, LLC (“PJM”) region to subsidize the coal and nuclear plants of FES and others. Requiring customers to subsidize certain coal-fired and nuclear facilities in PJM would inflict unjust, unreasonable and unduly discriminatory rates on Ohio consumers and consumers throughout the PJM region. Subsidizing certain power plants (and not others) would also undermine the functioning competitive wholesale market that provides consumers reliable electric service at the lowest possible cost.

FES’ extraordinary Request is based on the flawed assumption that the PJM electric grid will collapse without coal and nuclear resources, and consumers will experience blackouts and energy supply shortages. Nothing could be further from the truth.

To the contrary, PJM (the entity charged with the responsibility for keeping the lights on in the PJM region) flatly rejected FES' Request, stating that “without reservation there is no immediate threat to system reliability.”¹ PJM reliably operates the grid, and has more than adequate supplies available to reliably serve consumers into the foreseeable future. Just three months ago, the Federal Energy Regulatory Commission (“FERC”) agreed with PJM’s assessment when it terminated another docket (Docket No. RM18-1-000), regarding essentially the same relief FES seeks here. FES did not seek rehearing of that ruling, and its filing here is an unjustified collateral attack on that ruling.

FES’ extraordinary request is also fundamentally unjust and unreasonable for consumers. It comes at a time when market prices for electricity are low due in large part to the abundant supplies of natural gas that exist today in PJM. Consumers in Ohio and elsewhere in PJM are beginning to see lower prices for electricity from market-based pricing – after electric suppliers like FES received much higher market prices that prevailed during the 2000’s. All markets experience price swings as a result of changes in economic conditions, market fundamentals, and technological advancements.

FES essentially seeks to secure profits for shareholders during the “good times” (when market prices are high) and secure subsidies from customers for shareholders during the “bad times” (when market prices are low). In this respect, FES’s Request would create a perverse ratemaking formula where Ohioans and other PJM electric customers always would pay the higher of market-based or cost-based rates. And this result would subvert PJM’s functioning competitive markets that provide consumers

¹ PJM Letter to Secretary Perry re FES’ Request for Emergency Relief under Section 202 of the Federal Power Act at 1 (March 30, 2018).

reliable electric service at the lowest possible cost. The U.S. DOE should reject the extraordinary subsidy that FES seeks from consumers.

FES claims a concern for the reliability of the U.S. electric grid. But its real concern is that low prices for natural gas in PJM's markets have caused FES' coal-fired and nuclear resources to be uneconomic. Indeed, FES filed for bankruptcy just days after it filed its Request in this proceeding. FES' financial woes, however, are not the type of emergency Congress envisioned when it provided the DOE emergency powers regarding electricity supply.² In order to protect the residential energy consumers in Ohio, OCC requests that DOE refrain from taking the unprecedented action sought by FES. FES' Request should be rejected.

A. The DOE has no legal means to approve wholesale power contracts between PJM and the power plant owners and charge those rates to customers as FES requests.

FES requested that the DOE order PJM to enter into cost-based contracts with the owners of every coal and nuclear plant in the region. If the parties are unable to reach agreement on the amount of the subsidies, FES requests that the Secretary determine the compensation amount. But there is no legal mechanism by which the DOE could grant FES' Request.

PJM could negotiate contracts with each coal and nuclear plant in the region to compensate it for its cost of providing service. But those contracts are subject to a determination that the plant is needed for reliability under PJM's existing Open Access Transmission Tariff. The contracts are also subject to FERC's regulatory oversight to

² 16 U.S.C. § 824a(c); *see also* Department regulations, 10 C.F.R. § 205.371 (“[s]ituations where shortage of electric energy is projected due solely to the failure of the parties to agree to terms, conditions, or other economic factors relating to service, generally will not be considered emergencies unless the inability to supply electric service is imminent.”).

ensure that the rates produced in such contracts are just and reasonable under Section 204 of the Federal Power Act, 16 U.S.C. § 824d.

The courts have long held that FERC (and not DOE) has the exclusive regulatory authority to set wholesale electric rates.³ The law provides FERC the same rate-setting authority under Federal Power Act Section 202(C) requests for emergency relief from the DOE.⁴ There is no legal authority for DOE to circumvent and subvert FERC's jurisdiction over the wholesale electric rates for these resources.

B. There is no emergency or threat to Ohio or other PJM consumers that would justify the emergency action sought by FirstEnergy Solutions.

FES requests that the DOE take the unprecedented step of declaring an emergency. But there is no emergency. FES does not claim that consumers' lights have gone out due to shortages in energy supplies in the PJM region. Nor does FES claim that consumers' lights are likely to go out in the foreseeable future. In fact, the opposite is true. PJM's markets operate on a three-year forward procurement basis. That means that PJM has already procured today all of the capacity it needs to reliably serve customers through May of 2022.

In each year since PJM first began electric market operations, its markets have procured significantly more resources than were needed to reliably serve customers,

³ *Hughes v. Talen*, 136 S.Ct. 1288, 1291 (2016) ("The Federal Power Act (FPA), 41 Stat. 1063, as amended, 16 U.S.C. § 791a *et seq.*, vests in the Federal Energy Regulatory Commission (FERC) *exclusive jurisdiction over wholesale sales of electricity in the interstate market.*") (emphasis added).

⁴ See 10 C.F.R. § 205.376 ("The applicant and the generating or transmitting systems from which emergency service is requested are encouraged to utilize the rates and charges contained in approved existing rate schedules or to negotiate mutually satisfactory rates for the proposed transactions. In the event that the DOE determines that an emergency exists under section 202(c), and the "entities" are unable to agree on the rates to be charged, **the DOE shall prescribe the conditions of service and refer the rate issues to the Federal Energy Regulatory Commission for determination by that agency in accordance with its standards and procedures**") (emphasis added).

including this year and each of the next three years.⁵ In the May 2018 PJM capacity auction, PJM's capacity market procured 163,627 megawatts ("MW") of capacity for the delivery period 2021/2022. That capacity is for serving customers under a projected peak demand of 152,647 MW,⁶ resulting in a reserve margin above the level needed in excess of 21%.⁷ Additionally, there are significant quantities of new electric capacity entering the market each year, with more than 51,000 MW of new generating capacity entering the market since 2006.⁸ The net of additions reached more than 24,000 MW over that period.⁹ Contrary to FES' allegations, the reliability of the electric supply in the PJM region is simply not a concern for consumers.

The resilience of PJM's portfolio of supplies is also not a cause for concern for customers. PJM's 2017 Fuel Mix report demonstrates that the grid would be operationally reliable for customers even with 86% of its generator fuel mix comprised of natural gas generating plants.¹⁰ Additionally, PJM's analysis of the reliability attributes of the different types of power plants on its system shows that natural gas plants provide for customers almost the same level of flexibility as coal plants, and provide significantly greater flexibility than nuclear plants.¹¹ While PJM acknowledges that more work should

¹¹ Fuel Report at 16; *see also Grid Resilience in Regional Transmission Organizations and Independent System Operators*, Docket No. AD18-7-000, Comments and Responses of PJM Interconnection, L.L.C. at 71 (March 9, 2018) ("PJM Comments").

be done to improve the resilience of its system for customers, it maintains that the electric grid in its region “is safe and reliable today – it has been designed and is operated to meet all applicable reliability standards.”¹² The extent of the additional work needed to continue to provide consumers reliable service is the subject of FERC’s inquiry in Docket No. AD18-7-000. There is no evidence that would justify the DOE taking the unprecedented step of short-circuiting that process which assures consumers of reliable service.

Finally, FES’ claim that an emergency exists because PJM relied on coal and nuclear plants to provide customers service during the severe winter weather (in the first week of January 2018) is based on a flawed premise. FES is correct that PJM dispatched coal and nuclear resources to serve customers during the extreme winter weather in January 2018. However, the implication in FES’ statement that these plants were needed to serve customers because PJM had no other available sources of supply to serve customers is incorrect. FES fails to distinguish between dispatch and availability of resources for providing customers service.

PJM dispatched coal and nuclear resources in early January to serve customers because they were the lowest cost resources available during that severe “cold snap” when natural gas prices were quite high, not because it had no other sources of supply available. PJM had 137,939 MW of on-line generation during that period,¹³ and experienced 23,751 MW in capacity outages (29% of which were coal units),¹⁴

¹² PJM Comments at 4.

¹³ PJM Cold Snap Performance Dec. 28, 2017 to Jan. 7, 2018 at 13, PJM Interconnection (Feb. 26, 2018) (“Cold Snap Report”), available at <http://www.pjm.com/-/media/library/reports-notices/weather-related/20180226-january-2018-cold-weather-event-report.ashx>.

¹⁴ Cold Snap Report at 2.

accounting for 161,000 MW of PJM's total procured capacity for this past year of 167,000 MW.¹⁵ This means PJM still had more than 5,000 MW in procured capacity available if needed to serve customers.

More importantly, PJM had more than 187,473 MW of capacity in the region eligible to bid into the market for serving customers during the 2017/2018 time period.¹⁶ Some of the excess capacity may have been available for dispatch in addition to the excess 5,000 MW of procured capacity still available. PJM's study of its operations during that extreme cold weather event concluded that the grid "is diverse and strong and remains reliable" for customers.¹⁷ In other words, the market worked *exactly* as it was supposed to, providing customers with reliable electricity at the lowest possible cost.

C. FirstEnergy Solutions' Request ignores the existing, more targeted, and less expensive solution for Ohio and PJM consumers available in PJM's Tariff in the form of Reliability Must-Run contracts.

PJM has an existing mechanism for compensating resources at risk of retirement that are needed to reliably serve customers, Reliability Must Run ("RMR") contracts.¹⁸ FES noted in its Request that it had already announced to PJM that it planned to retire certain of its coal and nuclear resources. PJM indicated in its response to FES' Request in this proceeding that it is currently studying those notices and plans to issue a determination in the near future as to whether any of those generating plants are needed to reliably serve customers.

¹⁸ PJM Open Access Transmission Tariff, Section 113.

If PJM determines that the resources are needed for providing reliable service for customers, it will enter into RMR contracts, subject to FERC's regulation. Under RMR contracts the generation owner is paid its full costs for keeping the plants open. Thus, PJM already has all the tools it needs to ensure the reliability of the grid for customers without the DOE stepping in and ordering it to enter into such contracts. If needed, this existing tool can be used and is likely to cost consumers significantly less than the FES Request. This is because RMR contracts are executed only for those resources actually needed for reliability and only for limited amounts of time. FES's proposal on the other hand has nothing to do with what resources are actually needed to provide customers reliable electric service. Moreover, the RMR process comports with FERC's primary statutory responsibility, which is to provide consumers a "complete, permanent, and effective bond of protection from excessive rates and charges."¹⁹

D. FirstEnergy Solutions' Request, if granted, would result in a less reliable electric grid for consumers in Ohio and other parts of PJM.

Granting FES' Request would retain a significant quantity of uneconomic coal and nuclear resources in PJM that are not needed for providing reliable service to customers and that would otherwise retire. To customers' detriment, retention of these resources in PJM's competitive wholesale markets is likely to force other resources, which are economically viable, to leave the PJM market, or to discourage investment in new, more efficient generating plants.

PJM studies have shown that the average forced outage rate for generating plants at risk of retirement is 35%, which is significantly higher than the four percent system

¹⁹ *Atl. Ref. Co. v. Pub. Serv. Comm'n*, 360 U.S. 378, 388 (1959) (the FERC has an obligation to provide consumers a "complete, permanent, and effective bond of protection from excessive rates and charges.")

average forced outage rate for all resources on the system.²⁰ Thus, the retention of uneconomic resources that are at risk of retirement is likely to leave the PJM electric grid less reliable for customers, not more reliable. This would be bad for PJM consumers, including Ohio consumers. The DOE should reject FES' effort to bail itself out of bankruptcy by disrupting or destroying functioning electricity markets with customer-funded subsidies for uneconomic coal and nuclear plants. These FES power plants are on the verge of retirement and are less reliable for providing service to customers than the newer resources they would replace. The Request would unreasonably increase utility bills for millions of Ohio consumers.

E. CONCLUSION

OCC requests that the DOE reject the FES Request in order to protect Ohio consumers and consumers generally from paying subsidies and above-market prices for electricity in the PJM region. There is no evidence of a dire emergency that would justify the extraordinary relief FES seeks in this proceeding.

Respectfully submitted,
